ABSTRACT

This invention relates to novel compounds which are derivatives of the phosphodiesterase inhibitor, cilostazol, and pharmaceutically acceptable salts thereof. This invention also provides pyrogen-free compositions comprising one or more compounds of the invention and the use of the disclosed compounds and compositions in methods of treating diseases and conditions that are treated by administration of a phosphodiesterase inhibitor, such as cilostazol. The invention also relates to the use of the disclosed compounds and compositions as reagents in analytical studies involving cilostazol.
OTHER PUBLICATIONS

This application is a continuation of U.S. patent application Ser. No. 12/150,107, filed Apr. 24, 2008, and claims the benefit of U.S. Provisional Application No. 60/926,100, filed on Apr. 25, 2007.

The entire teachings of the above application(s) are incorporated herein by reference.

BACKGROUND OF THE INVENTION

Cilostazol is known by the chemical name 6-[4-(1-Cyclohexyl-1H-tetrazol-5-yl)butoxy]-3,4-dihydro-2(1H)-quinolinone. It is marketed under the tradename PLETAL® (Otsuka America Pharmaceutical, Inc.) in the United States for the treatment of intermittent claudication and under the tradename PLETAL® in Japan and South Korea for the treatment of chronic arterial occlusive disease, including diabetic complications of the peripheral vasculature. Cilostazol is also approved in Europe. The recommended daily dose is 100 mg BID, with 50 mg BID recommended if co-administering strong inhibitors of CYP3A4 and CYP2C19.

Cilostazol is a selective inhibitor of phosphodiesterase III with antiplatelet and antithrombotic activity. More specifically, cilostazol and several of its metabolites are cyclic AMP (cAMP) phosphodiesterase III inhibitors (PDE III inhibitors), inhibiting phosphodiesterase activity and suppressing cAMP degradation. This action results in an increase in cAMP in platelets and blood vessels, leading to inhibition of platelet aggregation and vasodilation, respectively. For example, cilostazol reversibly inhibits platelet aggregation induced by a variety of stimuli, including thrombin, ADP, collagen, arachidonic acid, epinephrine, and shear stress.

Currently, there are fifteen ongoing clinical trials for cilostazol in the areas of cerebral infarction, cerebrovascular disorders, atherosclerosis, diabetes mellitus complications, peripheral vascular disease, Reynaud’s disease, intermittent claudication, ischemic heart disease, and acute coronary syndrome.

Additional trials are investigating cilostazol in combination with other therapeutics. For example, trials are investigating cilostazol in combination with aspirin in ischemic stroke patients (“Overcome Biochemical Aspirin Resistance [sic] Through Cilostazol Combination (ARCC)” and in combination with aspirin in chronic stroke patients studying the effect of aspirin plus cilostazol and aspirin alone on the progression of intracranial arterial stenosis, in 200 chronic stroke patients with 50-99% stenosis.

Despite the beneficial activities of cilostazol, there is a continuing need for new compounds to treat the aforementioned diseases and conditions.

SUMMARY OF THE INVENTION

This invention relates to novel compounds which are derivatives of the phosphodiesterase inhibitor, cilostazol and pharmaceutically acceptable salts thereof. This invention also provides pyrogen-free compositions comprising one or more compounds of the invention and the use of the disclosed compounds and compositions in methods of treating diseases and conditions that are treated by administration of a phosphodiesterase inhibitor, such as cilostazol. The invention also relates to the use of the disclosed compounds and compositions as reagents in analytical studies involving cilostazol.

DETAILED DESCRIPTION OF THE INVENTION

The terms “ameliorate” and “treat” are used interchangeably and include both therapeutic treatment and prophylactic treatment (reducing the likelihood of development). Both terms mean decrease, suppress, attenuate, diminish, arrest, or stabilize the development or progression of a disease (e.g., a disease or disorder delineated herein), lessen the severity of the disease or improve the symptoms associated with the disease.

By “disease” is meant any condition or disorder that damages or interferes with the normal function of a cell, tissue, or organ.

It will be recognized that some variation of natural isotopic abundance occurs in a synthesized compound depending upon the origin of chemical materials used in the synthesis. Thus, a preparation of cilostazol will inherently contain small amounts of deuterated isotopologues. The concentration of such naturally abundant stable hydrogen and carbon isotopes, notwithstanding this variation, is small and immaterial as compared to the degree of stable isotopic substitution of compounds of this invention. See, for instance, Wada, E., et al., Seikagaku, 66: 15 (1994); Ganes, L. Z., et al., Comp. Biochem. Physiol A Mol. Integr. Physiol., 119: 725 (1998).

The compounds of the present invention are distinguished from such naturally occurring minor forms in that the term “compound” as used in this invention refers to a composition of matter that has a minimum isotopic enrichment factor of at least 500 (7.5% deuterium incorporation) for each deuterium atom that is present at a site designated as a site of deuteration in Formula (I).

In the compounds of the invention any atom not specifically designated as a particular isotope is meant to represent any stable isotope of that atom unless otherwise stated. Unless otherwise stated, when a position is designated specifically as “1H” or “hydrogen,” the position is understood to have hydrogen at its natural abundance isotopic composition.

The term “isotopic enrichment factor” as used herein means the ratio between the isotopic abundance at a specified position in a compound of this invention and the naturally occurring abundance of that isotope. The natural abundance of deuterium is 0.015%.

In other embodiments, a compound of this invention has an isotopic enrichment factor for each deuterium present at a site designated as a potential site of deuteration on the compound of at least 1000 (15% deuterium incorporation), at least 1500 (22.5% deuterium incorporation), at least 2000 (30% deuterium incorporation), at least 2500 (37.5% deuterium incorporation), at least 3000 (45% deuterium incorporation), at least 3500 (52.5% deuterium incorporation), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation), at least 6466.7 (97% deuterium incorporation), at least 6633.3 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

It is understood that the isotopic enrichment factor of each deuterium present at a site designated as a site of deuteration is independent of other deuterated sites. For example, if there are two sites of deuteration on a compound one site could be deuterated at 22.5% while the other could be deuterated at 37.5% and still be considered a compound wherein the isotopic enrichment factor is at least 1500 (22.5%).

The structural formula depicted herein may or may not indicate whether atoms at certain positions are isotopically enriched. In a most general embodiment, when a structural
formula is silent with respect to whether a particular position is isotope enriched, it is to be understood that the stable isotopes at the particular position are present at natural abundance, or, alternatively, that that particular position is isotope enriched with one or more naturally occurring stable isotopes. In a more specific embodiment, the stable isotopes are present at natural abundance at all positions in a compound not specifically designated as being isotope enriched.

The term “isotopologue” refers to a species that differs from a specific compound of this invention only in the isotopic composition thereof or of its ions. Isotopologues can differ in the level of isotopic enrichment at one or more positions and/or in the position(s) of isotopic enrichment.

The term “compound,” as used herein, is also intended to include any salts, solvates, or hydrates thereof. Thus, it is to be understood that when any compound is referred to herein by name and structure, salts, solvates, and hydrates thereof are included.

A salt of a compound of this invention is formed between an acid and a basic group of the compound, such as an amino functional group, or a base and an acidic group of the compound, such as a carboxyl functional group. According to another embodiment, the compound is a pharmaceutically acceptable acid addition salt.

The term “pharmaceutically acceptable,” as used herein, refers to a component that is, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and other mammals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. A “pharmaceutically acceptable salt” means any non-toxic salt that, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention. A “pharmaceutically acceptable counterion” is an ionic portion of a salt that is not toxic when released from the salt upon administration to a recipient.

Acids commonly employed to form pharmaceutically acceptable salts include inorganic acids such as hydrogen bisulfide, hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid and phosphoric acid, as well as organic acids such as para-toluene sulfonic acid, salicylic acid, tartaric acid, bitartaric acid, ascorbic acid, maleic acid, benzilic acid, fumaric acid, gluconic acid, glucuronic acid, formic acid, glutamic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, lactic acid, oxalic acid, para-bromophenylsulfonic acid, carboxylic acid, succinic acid, citric acid, benzoic acid and acetic acid, as well as related inorganic and organic acids. Such pharmaceutically acceptable salts include, for example, sodium, potassium, lithium, calcium, magnesium, iron, copper, zinc, tin, iodine, chloride, bromide, iodide, phosphate, monohydrogen phosphate, dihydrogen phosphate, metaphosphate, pyrophosphate, chlorides, bromides, iodides, acetate, propionate, deconate, caprylate, acetate, formate, isobutyrate, caprate, heptanoate, propionate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, butyrate-1,4-dioate, hexyrate-1,6-dioate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, terephthalate, sulfoxide, xylene sulfoxide, phenylacetate, phenylpropionate, phenylbutyrate, citrate, lactate, hydroxybutyrate, glycolate, maleate, tartrate, methanesulfonate, propanesulfonate, naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate and other salts. In one embodiment, pharmaceutically acceptable acid addition salts include those formed with mineral acids such as hydrochloric acid and hydrobromic acid, and especially those formed with organic acids such as maleic acid.

As used herein, the term “hydrate” means a compound which further includes a stoichiometric or non-stoichiometric amount of water bound by non-covalent intermolecular forces.

As used herein, the term “solvate” means a compound which further includes a stoichiometric or non-stoichiometric amount of solvent such as water, acetone, ethanol, methanol, dichloromethane, 2-propanol, or the like, bound by non-covalent intermolecular forces.

The disclosed compounds may exist in various stereoisomeric forms. Stereoisomers are compounds which differ only in their spatial arrangement. Enantiomers are pairs of stereoisomers whose mirror images are not superimposable, most commonly because they contain an asymmetrically substituted carbon atom that acts as a chiral center. “Enantiomer” means one of a pair of molecules that are mirror images of each other and are not superimposable. Diastereomers are stereoisomers that are not related as mirror images, most commonly because they contain two or more asymmetrically substituted carbon atoms. “R” and “S” represent the configuration of substituents around one or more chiral carbon atoms.

When the stereochemistry of the disclosed compounds is named or depicted by structure, the named or depicted stereoisomer is at least 60%, 70%, 80%, 90%, 99% or 99.9% by weight pure relative to the other stereoisomers. When a single enantiomer is named or depicted by structure, the depicted or named enantiomer is at least 60%, 70%, 80%, 90%, 99% or 99.9% optically pure. Percent optical purity by weight is the ratio of the weight of the enantiomer over the weight of the enantiomer plus the weight of its optical isomer.

When a disclosed compound is named or depicted by structure without indicating the stereochemistry, and has at least one chiral center, it is to be understood that the name or structure encompasses one enantiomer of inhibitor free from the corresponding optical isomer, a racemic mixture of the inhibitor and mixtures enriched in one enantiomer relative to its corresponding optical isomer.

When a disclosed compound is named or depicted by structure without indicating the stereochemistry and has at least two chiral centers, it is to be understood that the name or structure encompasses a diastereomer free of other diastereomers, a pair of diastereomers free from other diastereomeric pairs, mixtures of diastereomers, mixtures of diastereomeric pairs, mixtures of diastereomers in which one diastereomer is enriched relative to the other diastereomer(s) and mixtures of diastereomeric pairs in which one diastereomeric pair is enriched relative to the other diastereomeric pair(s).

The term “stable compounds,” as used herein, refers to compounds which possess stability sufficient to allow for their manufacture and which maintain the integrity of the compound for a sufficient period of time to be useful for the purposes detailed herein (e.g., formulation into therapeutic products, intermediates for use in production of therapeutic compounds, isolatable or storable intermediate compounds, treating a disease or condition responsive to therapeutic agents).

“D” refers to deuterium.

“Stereoisomer” refers to both enantiomers and diastereomers.

“t” refers to tertiary.

“US” refers to the United States of America.

“FDA” refers to Food and Drug Administration.

“NDA” refers to New Drug Application.
As used herein, "each Y" variable includes, independently, any "Y" group (e.g., Y₁, Y₂, Y₃, and Y₄).

The term "perdeutero-cyclohexyl" refers to a cyclohexyl group where all the hydrogen are replaced with deuterium.

Therapeutic Compounds

The present invention provides compounds represented by Formula (I):

\[
\text{Rings A} \quad \text{and \ Q} \\
\text{are \ per-deuterocyclohexyl, \ or \ cyclohexyl,} \\
\text{or \ a \ pharmaceutically \ acceptable \ salt \ thereof.}
\]

Ring A is a cyclohexyl ring having 0-11 deuterium. Q is \(-\text{CH₂CH₂}-\) or \(-\text{CH=CH}-\) where one or more of the hydrogen in Q is optionally replaced by deuterium. Each Y variable is independently selected from hydrogen or deuterium; and at least one Y variable is deuterium or there is at least one deuterium substituent in Q or Ring A, with the proviso that if the only sites of deuteration are on Ring A, Ring A is not a 2,2,6,6-tetradideuterocyclohexyl group. A tetradideuterocyclohexyl group is represented by the following structure:

In one embodiment, Y¹ and Y² are the same and Y³ and Y⁴ are the same. In one embodiment, Y¹ and Y² are simultaneously deuterium or Y³ and Y⁴ are simultaneously deuterium. In a particular embodiment, Y¹ and Y² are simultaneously deuterium and Y³ and Y⁴ are simultaneously hydrogen. In another embodiment, Ring A is perdeuterocyclohexyl, each Y variable is deuterium and Q is \(-\text{CD₂CH₂}\) or \(-\text{CD=CD}\).

In another embodiment, Q is \(-\text{CH₂CH₂}-\), \(-\text{CD₂CD₂}\), \(-\text{CD=CH}\), or \(-\text{CD=CD}\).

In a particular embodiment, Ring A is per-deuterocyclohexyl or 4,4-dideuterocyclohexyl, each Y is hydrogen and Q is \(-\text{CH₂CH₂}-\) or \(-\text{CH=CH}-\).

In a particular embodiment, Ring A is natural abundance cyclohexyl and each Y variable is hydrogen.

In another embodiment, Ring A is: 4,4-dideuterocyclohexyl, or cyclohexyl, 4,4-dideuterocyclohexyl.

In another embodiment, Q is \(-\text{CH₂CH₂}-\), \(-\text{CD₂CD₂}\), \(-\text{CH=CH}\), or \(-\text{CD=CD}\).

In a particular embodiment, Ring A is per-deuterocyclohexyl or 4,4-dideuterocyclohexyl, each Y is hydrogen and Q is \(-\text{CD₂CH₂}\) or \(-\text{CD=CD}-\).

In yet another embodiment, Ring A is perdeuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\).

In another particular embodiment, Ring A is perdeuterocyclohexyl, and each Y variable is hydrogen.

In a particular embodiment, Ring A is per-deuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\). In another embodiment, Ring A is perdeuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\). In another embodiment, Ring A is perdeuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\). In a further embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\). In yet another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\). In still another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\) or \(-\text{CD=CD}\).

In another particular embodiment, Ring A is perdeuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In yet another embodiment, Q is \(-\text{CH₂CH₂}-\), \(-\text{CD₂CD₂}\), \(-\text{CH=CH}\), or \(-\text{CD=CD}\).

In a particular embodiment, Ring A is per-deuterocyclohexyl or 4,4-dideuterocyclohexyl, each Y is hydrogen and Q is \(-\text{CH₂CH₂}-\) or \(-\text{CH=CH}-\).

In a particular embodiment, Ring A is natural abundance cyclohexyl and each Y variable is hydrogen.

In another embodiment, Ring A is 4,4-dideuterocyclohexyl and each Y variable is hydrogen. In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CH₂CH₂}-\) or \(-\text{CH=CH}\). In yet another embodiment, Q is \(-\text{CD₂CD₂}\). In still another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a particular embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a further embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a particular embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a particular embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a particular embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In another embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\). In a particular embodiment, Ring A is 4,4-dideuterocyclohexyl, each Y variable is hydrogen, and Q is \(-\text{CD₂CD₂}\).

In yet another embodiment, the compound is a compound of Formula (I) selected from any one of the compounds set forth in Table 1, wherein each Y is hydrogen.

In an even more specific embodiment, the compound is selected from:

In another set of embodiments, any atom not designated as deuterium in any of the embodiments set forth above is present at its natural isotopic abundance.

Compositions

In another embodiment, the invention also provides pyrogen-free compositions comprising an effective amount of a compound of Formula (I) (e.g., including any of the formulae herein), or a pharmaceutically acceptable salt thereof and an acceptable carrier. Preferably, a composition of this invention is formulated for pharmaceutical use (“a pharmaceutical composition”), wherein the carrier is a pharmaceutically acceptable carrier. The carrier(s) must be “acceptable” in the sense of being compatible with the other ingredients of the formulation and, in the case of a pharmaceutically acceptable carrier, not deleterious to the recipient thereof in amounts typically used in medicaments.

Pharmaceutically acceptable carriers, adjuvants and vehicles that may be used in the pharmaceutical compositions of this invention include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, polyethylene glycol and wool fat.

If required, the solubility and bioavailability of the compounds of the present invention in pharmaceutical compositions may be enhanced by methods well-known in the art. One method includes the use of lipid excipients in the formulation. See “Oral Lipid-Based Formulations: Enhancing the Bioavailability of Poorly Water-Soluble Drugs (Drugs and the Pharmaceutical Sciences),” David J. Hauss, ed. Informa Healthcare, 2007; and “Role of Lipid Excipients in Modify-
The sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer’s solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant.

The pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing a compound of this invention with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art. See, e.g.: Rabinowitz, J. D. and Zaffarani, A. C., U.S. Pat. No. 6,803,031, assigned to Alexza Molecular Delivery Corporation.

Topical administration of the pharmaceutical compositions of this invention is especially useful when the desired treatment involves areas or organs readily accessible by topical application. For topical application to the skin, the pharmaceutical composition should be formulated with a suitable ointment containing the active components suspended or dissolved in a carrier. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax, and water. Alternatively, the pharmaceutical composition can be formulated with a suitable lotion or cream containing the active compound suspended or dissolved in a carrier. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldecanol, benzyl alcohol, and water. The pharmaceutical compositions of this invention may also be topically applied to the lower intestinal tract by rectal suppository formulation or in a suitable enema formulation. Topically-transdermal patches and iontophoretic administration are also included in this invention.

Application of the subject therapeutics may be local, so as to be administered at the site of interest. Various techniques can be used for providing the patient compositions at the site of interest, such as injection, use of catheters, trocars, project-
In another embodiment, the invention provides separate dosage forms of a compound of this invention and one or more of any of the above-described second therapeutic agents, wherein the compound and second therapeutic agent are associated with one another. The term “associated with one another” as used herein means that the separate dosage forms are packaged together or otherwise attached to one another such that it is readily apparent that the separate dosage forms are intended to be sold and administered together (within less than 24 hours of one another, consecutively or simultaneously).

As used herein, the term “effective amount” refers to an amount which, when administered in a proper dosing regimen, is sufficient to treat (therapeutically or prophylactically) the target disorder. For example, and effective amount is sufficient to reduce or ameliorate the severity, duration or progression of the disorder being treated, or prevent the advancement of the disorder being treated, cause the regression of the disorder being treated, or enhance or improve the prophylactic or therapeutic effect(s) of another therapy.

The interrelationship of dosages for animals and humans (based on milligrams per meter squared of body surface) is described in Freireich, et al., Cancer Chemother Rep., 50:219 (1966). Body surface area may be approximately determined from height and weight of the patient. See, e.g., Scientific Tables, Geigy Pharmaceuticals, Ardsley, N.Y., 1970, 537.

In one embodiment, an effective amount of a compound of this invention can range from about 20 mg/day to about 400 mg/day. Administration can be in one or more doses per day (e.g., multiple doses). When multiple doses are used, the amount of each dose can be the same or different.

In a particular embodiment, an effective amount of a compound of this invention can range from about 20 mg/day to about 200 mg/day, from about 25 mg/day to about 200 mg/day, from about 30 mg/day to about 200 mg/day, from about 35 mg/day to about 200 mg/day, from about 40 mg/day to about 200 mg/day, from about 45 mg/day to about 200 mg/day, from about 50 mg/day to about 200 mg/day, from about 55 mg/day to about 200 mg/day, from about 60 mg/day to about 200 mg/day, from about 65 mg/day to about 200 mg/day, from about 70 mg/day to about 200 mg/day, from about 75 mg/day to about 200 mg/day, from about 80 mg/day to about 200 mg/day, from about 85 mg/day to about 200 mg/day, from about 90 mg/day to about 200 mg/day, from about 95 mg/day to about 200 mg/day, or about 100 mg/day to about 200 mg/day.

Effective doses will also vary, as recognized by those skilled in the art, depending on the diseases treated, the severity of the disease, the route of administration, the sex, age and general health condition of the patient, excipient usage, the possibility of co-usage with other therapeutic treatments such as use of other agents and the judgment of the treating physician.

For pharmaceutical compositions that comprise a second therapeutic agent, an effective amount of the second therapeutic agent is between about 20% and 100% of the dosage normally utilized in a monotherapy regime using just that agent. Preferably, an effective amount is between about 70% and 100% of the normal monotherapy dose. The normal monotherapy dosages of these second therapeutic agents are well known in the art. See, e.g., Wells, et al., eds., Pharmacotherapy Handbook, 2nd Edition, Appleton and Lange, Stamford, Conn. (2000); PDR Pharmacopoeia, Tarascon Pocket Pharmacopoeia 2000, Deluxe Edition, Tarascon Publishing, Loma Linda, Calif. (2000), each of which references are incorporated herein by reference in their entirety.
Some of the second therapeutic agents referenced above may act synergistically with the compounds of this invention. When this occurs, it will allow the effective dosage of the second therapeutic agent and/or the compound of this invention to be reduced from that required in a monotherapy. This has the advantage of minimizing toxic side effects of either the second therapeutic agent of a compound of this invention, synergistic improvements in efficacy, improved ease of administration or use and/or reduced overall expense of compound preparation or formulation.

Methods of Treatment

The invention also provides a method of treating a disease that is susceptible to treatment by an antagonist of the phosphodiesterase III comprising the step of administering to a patient in need thereof an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt of such a compound. 

Diseases or conditions susceptible to treatment by inhibition of phosphodiesterase III include, but are not limited to: chronic arterial occlusive disease, diabetic mellitus complications (e.g., complication of peripheral), intermittent claudication, intimal proliferation, restenosis, intracranial arterial stenosis, recurrent strokes, cerebral infarction, cerebrovascular disorders, atherosclerosis, atherothrombosis complications, peripheral vascular disease, Reynaud’s Disease, sexual dysfunction, ulcers, cerebral circulation impairment, thrombolytic disorders, inflammation, hypotension, asthma, ischemic heart disease, coronary heart disease and acute coronary syndrome.

In a particular embodiment, the method of the invention is used to treat chronic arterial occlusive disease, intermittent claudication or stroke in a patient in need thereof comprising administering to the patient an effective amount of a compound of Formula (I) or a pharmaceutical composition comprising a compound of Formula (I) and a pharmaceutically acceptable carrier.

In another particular embodiment, the method of the invention is used to treat a patient suffering from or susceptible to Type 2 diabetes or metabolic syndrome X.

Methods delineated herein also include those wherein the patient is identified as in need of such treatment by subjective (e.g., opinion) or objective (e.g., measurable by a test or diagnostic method).

In another embodiment, the above methods of treatment comprise the further step of co-administering to the patient one or more second therapeutic agents. The choice of second therapeutic agent may be made from one or more additional compounds of the invention, or any second therapeutic agent known to be useful for co-administration with cilostazol. The choice of second therapeutic agent is also dependent upon the particular disease or condition to be treated. Examples of second therapeutic agents that may be employed in the methods of this invention are those set forth above for use in combination compositions comprising a compound of this invention and a second therapeutic agent.

In one embodiment, the second therapeutic agent is selected from aspirin, clopidogrel or a combination thereof, and the patient is suffering from or susceptible to type 2 diabetes or metabolic syndrome X.

The term “co-administered” as used herein means that the second therapeutic agent may be administered together with a compound of this invention as part of a single dosage form (such as a composition of this invention comprising a compound of the invention and an second therapeutic agent as described above) or as separate, multiple dosage forms. Alternatively, the additional agent may be administered prior to, consecutively with, or following the administration of a compound of this invention. In such combination therapy treatment, both the compounds of this invention and the second therapeutic agent(s) are administered by conventional methods. The administration of a composition of this invention, comprising both a compound of the invention and a second therapeutic agent, to a patient does not preclude the separate administration of that same therapeutic agent, any other second therapeutic agent or any compound of this invention to the patient at another time during a course of treatment.

Effective amounts of these second therapeutic agents are well known to those skilled in the art and guidance for dosing may be found in patents and published patent applications referenced herein, as well as in Wells, et al., eds., Pharmacotherapy Handbook, 2nd Edition, Appleton and Lange, Stamford, Conn. (2000); PDR Pharmacopoeia, Tarascon Pocket Pharmacopoeia 2000, Deluxe Edition, Tarascon Publishing, Loma Linda, Calif. (2000), and other medical texts. However, it is well within the skilled artisan’s purview to determine the second therapeutic agent’s optimal effective-amount range.

In one embodiment of the invention, where a second therapeutic agent is administered to a patient, the effective amount of the compound of this invention is less than its effective amount would be where the second therapeutic agent is not administered. In another embodiment, the effective amount of the second therapeutic agent is less than its effective amount would be where the compound of this invention is not administered. In this way, undesired side effects associated with high doses of either agent may be minimized. Other potential advantages (including including improved dosing regimens and/or reduced drug cost) will be apparent to those of skill in the art.

When the compounds, pharmaceutically acceptable salts thereof, compositions and pharmaceutical compositions of this invention are co-administered with another antiplatelet agent (e.g., aspirin or clopidogrel), the patient benefit from reduction of platelet aggregation that leads to other disorders.

In yet another aspect, the invention provides a compound of Formula (I), a pharmaceutically acceptable salt thereof, or a pharmaceutical composition of Formula (I), alone or together with one or more of the above-described second therapeutic agents for treatment or prevention in a patient of a disease, disorder or symptom set forth above. In a particular embodiment the disease is stroke. In a more particular embodiment, the disease is stroke and the second agent is aspirin or clopidogrel.

In other aspects, the methods herein include those further comprising monitoring patient response to the treatment administrations. Such monitoring can include periodic sampling of patient tissue, fluids, specimens, cells, proteins, chemical markers, genetic materials, etc. as markers or indicators of the treatment regimen. In other methods, the patient is prescreened or identified as in need of such treatment by assessment for a relevant marker or indicator of suitability for such treatment.

In another embodiment, the invention provides a method of modulating the activity of phosphodiesterase III in a cell, comprising contacting a cell with one or more compounds of Formula (I), a pharmaceutically acceptable salt thereof, or pharmaceutical compositions of Formula (I) as described herein.
Diagnostic Methods and Kits

The compounds and compositions of this invention are also useful as reagents in methods for determining the concentration of cilostazol in solution or biological sample such as plasma, examining the metabolism of cilostazol and other analytical studies.

According to one embodiment, the invention provides a method of determining the concentration, in a solution or a biological sample, of cilostazol, comprising the steps of:

a) adding a known concentration of a compound of Formula I to the solution of biological sample;

b) subjecting the solution or biological sample to a measuring device that distinguishes cilostazol from a compound of Formula I;

c) calibrating the measuring device to correlate the detected quantity of the compound of Formula I with the known concentration of the compound of Formula I added to the biological sample or solution; and

d) measuring the quantity of cilostazol in the biological sample with the calibrated measuring device; and

e) determining the concentration of cilostazol in the solution of sample using the correlation between detected quantity and concentration obtained for a compound of Formula I.

Measuring devices that can distinguish cilostazol from the corresponding compound of Formula I include any measuring device that can distinguish between two compounds that differ from one another only in isotopic abundance. Examples of measuring devices include a mass spectrometer, NMR spectrometer, or IR spectrometer.

In another embodiment, the invention provides a method of evaluating the metabolic stability of a compound of Formula I comprising the steps of contacting the compound of Formula I with a metabolizing enzyme source for a period of time and comparing the amount of the compound of Formula I with the metabolic products of the compound of Formula I after the period of time.

In a related embodiment, the invention provides a method of evaluating the metabolic stability of a compound of Formula I in a patient following administration of the compound of Formula I. This method comprises the steps of obtaining a serum, urine or feces sample from the patient at a period of time following the administration of the compound of Formula I to the patient; and comparing the amount of the compound of Formula I with the metabolic products of the compound of Formula I in the serum, urine or feces sample.

The present invention also provides kits for use to treat chronic arterial occlusive disease, diabetic mellitus complications (e.g., complication of peripheral vasculature), intermittent claudication, intimal proliferation, restenosis, intracranial arterial stenosis, recurrent strokes, cerebral infarction, cerebrovascular disorders, artherosclerosis, atherothrombosis complications, peripheral vascular disease, Raynaud’s Disease, sexual dysfunction, ulcers, cerebral circulation impairment, thrombolytic disorders, inflammation, hypotension, asthma, ischemic heart disease, coronary heart disease and acute coronary syndrome.

These kits comprise (a) a pharmaceutical composition comprising a compound of Formula (I), a pharmaceutically acceptable thereof or a composition of Formula (I), wherein the pharmaceutical composition is in a container; and (b) instructions describing a method of using the pharmaceutical composition to treat chronic arterial occlusive disease, diabetic mellitus complications (e.g., complication of peripheral vasculature), intermittent claudication, intimal proliferation, restenosis, intracranial arterial stenosis, recurrent strokes, cerebral infarction, cerebrovascular disorders, artherosclerosis, atherothrombosis complications, peripheral vascular disease, Raynaud’s Disease, sexual dysfunction, ulcers, cerebral circulation impairment, thrombolytic disorders, inflammation, hypotension, asthma, ischemic heart disease, coronary heart disease and acute coronary syndrome.

Examples include bottles, ampules, divided or multi-chambered holders bottles, wherein each division or chamber comprises a single dose of the composition, a divided foil packet wherein each division comprises a single dose of the composition, or a dispenser that dispenses single doses of the composition. The container can be in any conventional shape or form as known in the art which is made of a pharmaceutically acceptable material, for example, a paper or cardboard box, a glass or plastic bottle or jar, a re-sealable bag (for example, to hold a “refill” of tablets for placement into a different container), or a blister pack with individual doses for pressing out of the pack according to a therapeutic schedule. The container employed can depend on the exact dosage form involved, for example, a conventional cardboard box would not generally be used to hold a liquid suspension. It is feasible that more than one container can be used together in a single package to market a single dosage form. For example, tablets may be contained in a bottle, which is in turn contained within a box. In an embodiment, the container is a blister pack.

The kit can additionally comprise a memory aid of the type containing information and/or instructions for the physician, pharmacist or patient. Such memory aids include numbers printed on each chamber or division containing a dosage that corresponds with the days of the regimen which the tablets or capsules so specified should be ingested, or days of the week printed on each chamber or division, or a card which contains the same type of information. For single dose dispensers, memory aids further include a mechanical counter which indicates the number of daily doses that have been dispensed and a battery-powered micro-chip memory coupled with a liquid crystal readout and/or audible reminder signal which, for example, reads out the date that the last daily dose has been taken and/or reminds one when the next dose is to be taken. Other memory aids useful in such kits are a calendar printed on a card, as well as other variations that will be readily apparent.

The kits of this invention can also comprise a device to administer or to measure out a unit dose of the pharmaceutical composition. Such device may include an inhaler if the composition is an inhalable composition; a syringe and needle if the composition is an injectable composition; a syringe, spoon, pump, or a vessel with or without volume markings if the composition is an oral liquid composition; or any other measuring or delivery device appropriate to the dosage formulation of the composition present in the kit.

Synthetic Procedures

The synthesis of compounds of Formula (I) can be readily achieved by synthetic chemists of ordinary skill. Relevant procedures are disclosed, for instance in: U.S. Pat. No. 4,277,479; International Publication Nos. WO2004/062571 and WO20042014283; Japanese Applications JP2005350474 and JP2004506043; and the Chinese Applications CN1002-2602 20051226 and CN1002-8804 20050815.

Such methods can be carried out utilizing corresponding deuterated and optionally, other isotope-containing reagents to synthesize the compounds delineated herein, or invoking standard synthetic protocols known in the art for introducing isotopic atoms to a chemical structure.

A convenient method for synthesizing compounds of Formula (I) is depicted in the Scheme 1. Suitable methods for preparing intermediates useful in the synthesis of the compounds of Formula (I) are depicted in Schemes 2-3.
The synthetic methods described herein may also additionally include steps, either before or after any of the steps described in any scheme, to add or remove suitable protecting groups in order to ultimately allow synthesis of the compound of the formulae described herein. The methods delineated herein contemplate converting compounds of one formula to compounds of another formula. The process of converting refers to one or more chemical transformations, which can be performed in situ, or with isolation of intermediate compounds. The transformations can include reacting the starting compounds or intermediates with additional reagents using techniques and protocols known in the art, including those in the references cited herein. Certain intermediates can be used with or without purification (e.g., filtration, distillation, sublimation, crystallization, trituration, solid phase extraction, and chromatography).

Combinations of substituents and variables envisioned by this invention are only those that result in the formation of stable compounds.

A description of example embodiments of the invention follows.

The compounds of interest may be prepared in the following way.

Deuterated reagents and/or deuterated intermediates can be used where appropriate in the provided synthetic routes to afford the compounds of interest. For example, as shown in Scheme 1 a deuterated alcohol such as commercially-available cyclohexan-d11-ol 10 is reacted with commercially-available 5-chlorovaleronitrile 11 (or appropriately-deuterated versions thereof) in the presence of sulfuric acid to yield amide 12. Treatment with phosphorus pentachloride, followed by cyclization with hydrazoic acid affords chloride 13. Alkylation of commercially-available 3,4-dihydro-6-hydroxy-2(1H)-quinolinone 14 in the presence of DBU, NaOH and KOH affords desired deuterated compounds such as 106.

Scheme 2 depicts the synthesis of deuterated lactam 19 which could be incorporated into the synthetic route of Scheme 1 to produce other desired deuterated compounds. As shown in Scheme 2, commercially-available ethyl 3-bromo propionate-2,2,3,3-d4 15 is hydrolyzed with aqueous KOH and is then converted to the acid chloride 16 via treatment with thionyl chloride. Acylation of commercially-available 4-aminophenol 17 affords amide 18. Friedel-Crafts reaction with aluminum trichloride provides desired deuterated lactam 19.

In yet another example, as shown in Scheme 3, deuterated lactam 24 could be produced from deuterated carboxylic acid 20 in a manner similar to that of Wang, T. C.; et al. Synthesis (1997), (1), 87-90, and then be incorporated into the synthetic route of Scheme 1 to produce other desired deuterated compounds.

Additional methods of synthesizing compounds of Formula (I) and their synthetic precursors, including those within routes not explicitly shown in schemes herein, are within the means of chemists of ordinary skill in the art. Methods for optimizing reaction conditions and, if necessary, minimizing competing by-products, are also known in the art. Reaction optimization and scale-up may advantageously utilize high-speed parallel synthesis equipment and computer-controlled microreactors (e.g., Design And Optimization in Organic Synthesis, 2nd Edition, Carlson, R., Ed, 2005; Elsevier Science Ltd.; Jähnisch, K., et al., Angew. Chem. Int. Ed. Engl. 2004, 43: 406; and references therein).

Examples

Example 1

Synthesis of 6-(4-(1-(cyclohexyl-d11)-1H-tetrazol-5-yl) butoxy)-3,4-dihydroquinolin-2(1H)-one (106). Compound 106 was prepared according to Scheme 4 below.
Synthesis of 6-(4-(1-(4,4-d2-cyclohexyl)-1H-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1H)-one (Compound 106). As depicted in Scheme 4 above, and in a similar manner to Compound 107 shown below, commercially-available cyclohexanone-d10 (1) was converted via a six-step sequence into desired Compound 106. HPLC (method: 20 mm C18-RP column—gradient method 2-95% ACN+0.1% formic acid in 3.3 min with 1.7 min hold at 95% ACN; Wavelength: 254 nm): retention time: 3.22 min. MS (M+H): 381.3.

Example 2

Synthesis of 6-(4-(1-(4,4-d2-cyclohexyl)-1H-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1H)-one (Compound 107). Compound 107 was prepared as outlined in Scheme 5 below. Details of the synthesis are set forth below.
chloride (3<500 mL). The combined organic phases were washed with brine (200 mL), dried over sodium sulfate (100 g) and concentrated under reduced pressure. The crude product was purified by chromatography on silica gel, eluting with heptanes/ethyl acetate (5:1), to give 12.5 g (88%) of benzyl (4,4-d2-cyclohexyl)carbamate 26 as a white solid. 1H NMR (CDCl3) δ: 7.38 (m, 5H), 5.08 (s, 1H), 4.62 (s, 1H), 3.53 (m, 1H), 1.92 (m, 2H), 1.71 (m, 2H), 1.32 (m, 2H), 1.14 (2H); MS (M+H): 236.3.

Synthesis of 4,4-d2-cyclohexylamine (27). A mixture of benzyl (4,4-d2-cyclohexyl)carbamate 26 (4 g, 17 mmol) in methylene chloride (60 mL) and 10% Pd—C (2 g) was hydrogenated (shaken) overnight at 3 Bar H2 pressure. The mixture was filtered through Celite and the pad washed with methylethyl chloride (200 mL). The filtrate was concentrated by distillation at atmospheric pressure to give crude 4,4-d2-cyclohexylamine 27 that was used directly for the next reaction.

Synthesis of 5-chloro-N-(4,4-d2-cyclohexyl)pentanamide (28). A solution of crude 4,4-d2-cyclohexylamine 27 (65.0 mg, 0.38 mmol) and triethylamine (2.4 mL, 18.5 mmol) in methylene chloride (20 mL) was cooled in an ice bath with and 5-chlorovaleryl chloride 4 (2 mL, 18.5 mmol) was added dropwise. The reaction mixture was allowed to warm to room temperature and was stirred overnight. The reaction mixture was diluted with methylene chloride (50 mL) and washed consecutively with saturated sodium bicarbonate solution, water, and brine. The combined organic phases were washed with brine, dried over sodium sulfate and concentrated under reduced pressure. The crude product was purified by chromatography on silica gel, eluting with 8:7.66 (m, 1), 6.68 (m, 3H), 4.18 (m, 1H), 3.98 (t, 2H), 2.92 (m, 2H), 2.00 (m, 10H), 1.43 (m, 2H); MS (M+H): 236.3.

The percents remaining of the test compounds in human and/or rat liver microsomes are summarized. The positive control (testosterone and propranolol) metabolism data are also summarized and include results from the assay performed with incubation of the test compounds. The natural
log of the percent remaining is plotted versus time. A linear fit
is used to determine the rate constant. The elimination half-
lives associated with the disappearance of the test and control
compounds are determined and their relative metabolic sta-
bility compared.

The teachings of all patents, published applications and
references cited herein are incorporated by reference in their
entirety.

While this invention has been particularly shown and
described with references to example embodiments thereof, it
will be understood by those skilled in the art that various
changes in form and details may be made therein without
departing from the scope of the invention encompassed by the
appended claims.

What is claimed is:
1. A compound selected from:

   Compound 106

   or a pharmaceutically acceptable salt of either of the forego-
ing, wherein each compound or pharmaceutically acceptable
salt thereof has an isotopic enrichment factor for each indi-
cated deuterium atom of at least 3000 and wherein for each
compound or pharmaceutically acceptable salt thereof any
atom not designated as deuterium is present at its natural
isotopic abundance.

2. A composition suitable for pharmaceutical use compris-
ing a compound of claim 1 and a pharmaceutically acceptable
carrier.

3. The composition of claim 2, further comprising a second
therapeutic agent useful in treating a patient suffering from or
susceptible to arterial occlusive disease, intermittent claudic-
ation or stroke.

4. The composition of claim 3, wherein the second thera-
peutic agent is selected from aspirin, clopidogrel and probu-
col.

5. A method of treating a disease selected from chronic
arterial occlusive disease, intermittent claudication, or stroke,
in a patient in need thereof, comprising the steps of adminis-
tering to the patient a pharmaceutically acceptable composi-
tion comprising:

   a) a compound selected from:

   Compound 106

   or a pharmaceutically acceptable salt thereof; and

   b) a pharmaceutically acceptable carrier,

   wherein for each compound or pharmaceutically accept-
able salt thereof any atom not designated as deuterium is
present at its natural isotopic abundance.

6. The method of claim 5, further comprising co-adminis-
tering to the patient in need thereof a second therapeutic agent
useful in treating arterial occlusive disease, intermittent clau-
dication or stroke.

7. The method of claim 6, wherein the second therapeutic
agent is selected from aspirin and clopidogrel.

8. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 3500
(52.5% deuterium incorporation).

9. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 4000
(60% deuterium incorporation).

10. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 4500
(67.5% deuterium incorporation).

11. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 5000
(75% deuterium).

12. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 5500
(82.5% deuterium incorporation).

13. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least 6000
(90% deuterium incorporation).

14. The compound of claim 1, wherein the isotopic enrich-
ment factor for each indicated deuterium atom is at least
6333.3 (95% deuterium incorporation).
