No. 14/208,968, filed Mar. 13, 2014 (now U.S. Pat. No. 8,916,582), which is a continuation of U.S. patent application Ser. No. 13/119,905, filed Jul. 1, 2011 (now U.S. Pat. No. 8,710,072), which is a National Stage application under 35 U.S.C. §371 of International Application No. PCT/US2009/057476, filed Sep. 18, 2009, which claims priority to U.S. Provisional Application Ser. No. 61/098,511, filed Sep. 19, 2008, all of which are incorporated by reference herein in their entireties.

TECHNICAL FIELD

This invention relates to novel morphinan compounds and pharmaceutically acceptable salts thereof. This invention also provides compositions comprising a compound of this invention and the use of such compositions in methods of treating diseases and conditions that are beneficially treated by administering a sigma-1 receptor agonist that also has NMDA antagonist activity.

BACKGROUND

Dextromethorphan, also known by its chemical name (+)-3-methoxy-17-methyl-(9a,13a,14a)-morphan, is currently one of the most widely used antitussives. In addition to the physiologic activity noted above, dextromethorphan is also an agonist of the σ2 receptor, an N-methyl-D-aspartate (NMDA) antagonist, and an α3β4 nicotinic receptor antagonist. Dextromethorphan inhibits neurotransmitters, such as glutamate, from activating receptors in the brain. Uptake of dopamine and serotonin are also inhibited.

Dextromethorphan is approved for use in over the counter cough suppressant products. It is currently in Phase I clinical trials for treating subjects with voice spasms, and Phase III clinical studies for treating Rett Syndrome (http://www.clinicaltrials.gov). Dextromethorphan is also in Phase I clinical trials for treating hyperalgesia in methadone-maintained subjects (http://www.clinicaltrials.gov/).

In addition, a combination of dextromethorphan hydrobromide and quinidine sulfate is currently in Phase III clinical trials for treating diabetic neuropathic pain (http://www.clinicaltrials.gov/). This drug combination, also known as Zemigia®, is in Phase III clinical trials for treating Involuntary Emotional Expression Disorder (IEED), also known as pseudobulbar affect, in subjects suffering from Alzheimer’s disease, Parkinson’s disease and traumatic brain injury (Ida, H., Clin Ther., 1997, March–April; 19(2): 215-31).

In addition to its antitussive properties, dextromethorphan has been shown to have anticonvulsant and neuroprotective effects possibly arising from N-methyl-D-aspartate (NMDA) antagonism of dextromethorphan (DM) and/or high-affinity DM σ receptors (Chou, Y.-C. et al., Brain Res., 1999, Mar. 13; 821(2): 516-9). Activation at the σ-1 receptor has been found to provide anticonvulsant action in rats and mice, like DM, but without the behavioral side effects produced by DM and its metabolite, dextromethorphan (Shin, E. J. et al., Br J Pharmacol., 2005, April; 144(7): 908-18 and Shin, E. J. et al., Behavioural Brain Research, 2004, 151: 267-274; 18(4): 332-7).

Metabolism of dextromethorphan in humans is known to proceed through cytochrome P450 catalyzed N-demethylation as well as 3-methyl oxidation. Greater than 98% of a dose of dextromethorphan is metabolized in healthy human males and none of the metabolites have been shown to have antitussive effects (Chou Y.-C., et al., Life Sci., 2005, Jul. 1; 77(7): 735-45 and Chou Y.-C., et al., J Pharm Sci., 2009, Jul. 1-15).

Accordingly, it is desirable to provide new compounds that have the beneficial activities of dextromethorphan, dimemorfan, dextrothorphan and dextroisoproporphan and may also have other benefits, e.g., reduced adverse side effects, with a decreased metabolic liability to further extend its pharmacological effective life, enhance subject compliance and, potentially, to decrease population pharmacokinetic variability and/or decrease its potential for dangerous drug-drug interactions or decrease the likelihood of dextromethorphan abuse due to the formation of untoward metabolites such as dextrorphan.

SUMMARY

Provided herein is a compound of Formula I:

$$\text{R}^1$$ is selected from $-O-(C_2-C_4)$alkyl and $-(C_1-C_4)$alkyl, wherein $\text{R}^1$ is optionally substituted with one or more deuterium atoms; and

$\text{R}^2$ is selected from CH3, CH2D, CHD2, and CD3; provided that at least one deuterium atom is present at either $\text{R}^1$ or $\text{R}^2$.

In some embodiments, $\text{R}^2$ is CH3 or CD3. In some of these embodiments, $\text{R}^1$ is CH3, CH2CH3, CH2CD3, CD3CH2, CH3CD3, CH2(CH3)2, CH3CD2, CD3CH2, CH2CD(CH3)2, CD3CH2, CH2CD3, or CD3CH2CH3. In some of these embodiments, $\text{R}^1$ is CH3, CH2CD3, CD3CH2, or CD3CH2CH3.

In some embodiments, the compound of Formula I is selected from any one of:

<table>
<thead>
<tr>
<th>Compound No.</th>
<th>$\text{R}^1$</th>
<th>$\text{R}^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>103</td>
<td>$-O-\text{CD}(\text{CH}_3)_2$</td>
<td>CD3</td>
</tr>
<tr>
<td>104</td>
<td>$-O-\text{CD}_3$</td>

<td>CH3</td>
</tr>
<tr>
<td>107</td>
<td>$-O-\text{CD}(\text{CD}_3)_2$</td>
<td>CH3</td>
</tr>
</tbody>
</table>

In some embodiments of the compound of Formula I, $\text{R}^1$ is $-(C_1-C_4)$alkyl which is optionally substituted with one or more deuterium atoms. In some of these embodiments, $\text{R}^2$ is CH3 or CD3. In some of these embodiments, $\text{R}^1$ is CH3, CH2CH3, CH2CD3, CD3CH2, CH3CD3, CH2(CH3)2, CH3CD2, CD3CH2, CH2CD(CH3)2, CD3CH2, CH2CD3, or CD3CH2CH3. In some of these embodiments, $\text{R}^1$ is CH3, CH2CD3, CD3CH2, or CD3CH2CH3.

In some embodiments, the compound of Formula I is selected from any one of:

<table>
<thead>
<tr>
<th>Compound No.</th>
<th>$\text{R}^1$</th>
<th>$\text{R}^2$</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

In some embodiments of the compound of Formula I, $\text{R}^1$ is $-(C_1-C_4)$alkyl which is optionally substituted with one or more deuterium atoms. In some of these embodiments, $\text{R}^2$ is CD3. In some of these embodiments, $\text{R}^1$ is CH3, CH2CH3, CH2CD3, CD3CH2, CH3CD3, CH2(CH3)2, CH3CD2, CD3CH2, CH2CD(CH3)2, CD3CH2, CH2CD3, or CD3CH2CH3. In some of these embodiments, $\text{R}^1$ is CD3. In some of these embodiments, the compound of Formula I is selected from any one of:

<table>
<thead>
<tr>
<th>Compound No.</th>
<th>$\text{R}^1$</th>
<th>$\text{R}^2$</th>

In some embodiments of the compounds of Formula I, any atom not designated as deuterium is present at its natural isotopic abundance.

Also provided is a pyrogen-free pharmaceutical composition comprising a compound of Formula I and a pharmaceutically acceptable carrier. In some embodiments, the composition further comprises a second therapeutic agent useful in treating a patient suffering from or susceptible to a disease or condition selected from emotional lability; pseudobulbar affect; autism; neurological disorders; neurodegenerative diseases; brain injury; disturbances of consciousness disorders; cardiovascular diseases; glaucoma; tardive dyskinesia; diabetic neuropathy; retinopathic diseases; diseases or disorders caused by homocysteine-induced apoptosis; diseases or disorders caused by elevated levels of homocysteine; pain, including but not limited to, chronic pain; intractable pain; neuropathic pain; sympathetically mediated pain; and pain associated with gastrointestinal dysfunction; epileptic seizures; tinnitus; sexual dysfunction; intractable coughing; dermatitis; addiction disorders; Rett syndrome (RTT); voice disorders due to uncontrollable laryngeal muscle spasms; methotrexate neurotoxicity; fatigue caused by cancer; and conditions related to exposure to chemical agents. Such chemical agents may include toxic agents such as, for example, (i) agents used in warfare or combat, such as for example nerve gas, or (ii) industrial pollutants.

In some embodiments, the second therapeutic agent is selected from quinidine, quinidine sulfate, oxycodone, and gabapentin.

Also provided is a method of treating a subject suffering from or susceptible to a disease or condition selected from emotional lability; pseudobulbar affect; autism; neurological disorders; neurodegenerative diseases; brain injury; disturbances of consciousness disorders; cardiovascular diseases; glaucoma; tardive dyskinesia; diabetic neuropathy; retinopathic diseases; diseases or disorders caused by homocysteine-induced apoptosis; diseases or disorders caused by elevated levels of homocysteine; pain, including but not limited to, chronic pain; intractable pain; neuropathic pain; sympathetically mediated pain; and pain associated with gastrointestinal dysfunction; epileptic seizures; tinnitus; sexual dysfunction; intractable coughing; dermatitis; addiction disorders; Rett syndrome (RTT); voice disorders due to uncontrollable laryngeal muscle spasms; methotrexate neurotoxicity; fatigue caused by cancer; and conditions related to exposure to chemical agents. Such chemical agents may include toxic agents such as, for example, (i) agents used in warfare or combat, such as for example nerve gas, or (ii) industrial pollutants.

In some embodiments, the subject in need thereof a therapeutically effective amount to chemical agents, comprising the step of administering to treated laryngeal muscle spasms; methotrexate neurotoxicity; fatigue caused by cancer; and conditions related to exposure to chemical agents. Such chemical agents may include toxic agents such as, for example, (i) agents used in warfare or combat, such as for example nerve gas, or (ii) industrial pollutants.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 depicts the metabolic stability of compounds of this invention in CYP2D6 SUPERSOMES™.

FIG. 2, panels A and B, depict the metabolic stability of dextroethorphan (panel A), dextroisoproporphan (panel B), and compounds of this invention in human liver microsomes.

FIG. 3 depicts the metabolic stability of dimemorfan and of compounds of this invention in human liver microsomes.
of this invention, with the exception of the positions of isotopic substitution and/or level of isotopic enrichment at one or more positions, e.g., H vs. D.

The term “compound,” as used herein, refers to a collection of molecules having an identical chemical structure, except that there may be isotopic variation among the constituent atoms of the molecules. Thus, it will be clear to those of skill in the art that a compound represented by a particular chemical structure containing indicated deuterium atoms, will also contain lesser amounts of isotopologues having hydrogen atoms at one or more of the designated deuterium positions in that structure. The relative amount of such isotopologues in a compound of this invention will depend upon a number of factors including the isotopic purity of deuterated reagents used to make the compound and the efficiency of incorporation of deuterium in the various synthesis steps used to prepare the compound. However, as set forth above the relative amount of such isotopologues will be less than 49.9% of the compound.

A salt of a compound of this invention is formed between an acid and a basic group of the compound, such as an amino functional group, or a base and an acidic group of the compound, such as a carboxyl functional group. According to another embodiment, the compound is a pharmaceutically acceptable acid addition salt.

The term “pharmaceutically acceptable,” as used herein, refers to a compound that is, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and other mammals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. A “pharmaceutically acceptable salt” means any suitable salt that, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention. A “pharmaceutically acceptable counterion” is an ionic portion of a salt that is not toxic when released from the salt upon administration to a recipient.

Acids commonly employed to form pharmaceutically acceptable salts include inorganic acids such as hydrogen bisulfide, hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid and phosphoric acid, as well as organic acids such as para-toluene sulfonic acid, salicylic acid, tartaric acid, bitartaric acid, ascorbic acid, maleic acid, benzoic acid and acetic acid, as well as related inorganic acids such as para-toluenesulfonic acid, salicylic acid, formic acid, glutamic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, lactic acid, oxalic acid, para-bromophenylsulfonic acid, carboxylic acid, succinic acid, citric acid, benzoic acid and acetic acid, as well as related inorganic and organic acids. Such pharmaceutically acceptable salts thus include sulfate, pyrosulfate, bisulfate, sulfate, bisulfite, phosphate, pyrophosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, decanoate, caprylate, acrylate, formate, isobutyrate, caprate, heptanoate, propionate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoxoate, methylbenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, terephthalate, sulfonate, xylene sulfonate, phenylacetate, phenylpropionate, phenylbutyrate, citrate, lactate, β-hydroxybutyrate, glycollate, maleate, tartrate, methanesulfonate, propanesulfonate, naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate and other salts. In one embodiment, pharmaceutically acceptable acid addition salts include those formed with mineral acids such as hydrochloric acid and hydrobromic acid, and especially those formed with organic acids such as maleic acid.

The term “stable compounds,” as used herein, refers to compounds which possess stability sufficient to allow for their manufacture and which maintain the integrity of the compound for a sufficient period of time to be useful for the purposes detailed herein (e.g., formulation into therapeutic products, intermediates for use in production of therapeutic compounds, isolatable or storable intermediate compounds, treating a disease or condition responsive to therapeutic agents).

Throughout this specification, a variable may be referred to generally (e.g., “each R”) or may be referred to specifically (e.g., R1 or R2). Unless otherwise indicated, when a variable is referred to generally, it is meant to include all specific embodiments of that particular variable.

The present invention provides a compound of Formula I:

or a pharmaceutically acceptable salt thereof, wherein:

R1 is —O—(C2-C4)alkyl or —(C2-C4)alkyl, wherein R1 is optionally substituted with one or more deuterium atoms; and

R2 is CH3, CH2D, CHD2, or CD3,

provided that at least one deuterium atom is present at either R1 or R2.

The preferred stereoechemistry of the present compounds is based on the stereoechemistry of morphinan compounds such as dextromethorphan, which exists as the dextrorotatory enantiomer of levorphanol.

One embodiment of the invention provides a compound of Formula I wherein R1 is —O—(C2-C4)alkyl which is optionally substituted with one or more deuterium atoms. In one aspect of this embodiment, R1 is —O—CH1(CH3)2, —O—CD2CD3, —O—CD2CH3, —O—CD2CH2D, —O—CD2CH2D, —O—CD3, —O—CD2CD3, —O—CD2CD2D, —O—CD2CD(D), —O—CD2CH(CH3)2, —O—CD2CH2D, —O—CD2CH2D, —O—CD2CD3, —O—CD2CD2D, or —O—CD2CD(D).

In another aspect, R1 is —O—CD2CD3, —O—CD2CH3, —O—CD2CH2D, —O—CD2CH2D, —O—CD2CD3, —O—CD2CD2D, —O—CD2CD(D), —O—CD2CH(CH3)2, —O—CD2CH2D, —O—CD2CH2D, —O—CD2CD3, —O—CD2CD2D, or —O—CD2CD(D).

In another aspect, R1 is —O—CD2CD3, —O—CD2CH3, —O—CD2CH2D, —O—CD2CH2D, —O—CD2CD3, —O—CD2CD2D, —O—CD2CD(D), —O—CD2CH(CH3)2, —O—CD2CH2D, —O—CD2CH2D, —O—CD2CD3, —O—CD2CD2D, or —O—CD2CD(D).
In another aspect, R\textsuperscript{1} is \(-\text{O} - \text{CD}CD\text{D}_2 \) or \(-\text{O} - \text{CD} \) \(\text{(CD}_3\text{)}_2\). In another aspect, R\textsuperscript{1} is \(-\text{O} - \text{CD}CD\text{D}_3\).

In another aspect, R\textsuperscript{2} is \(-\text{O} - \text{CD} \) \(\text{(CD}_3\text{)}_2\).

Another embodiment of Formula I provides a compound of Formula I wherein R\textsuperscript{1} is a deuterated \(-\text{O} - \text{C} \) \(\text{C}_3\text{C}_4\)alkyl and R\textsuperscript{2} is \(-\text{CD}_3\) or \(-\text{CH}_3\). In one aspect of this embodiment, R\textsuperscript{1} is \(-\text{CD}_3\). In another aspect R\textsuperscript{2} is \(-\text{CH}_3\).

Each of the above aspects of R\textsuperscript{1} may be combined with each of the above aspects of R\textsuperscript{2} to form further embodiments of this invention.

Examples of specific compounds where R\textsuperscript{1} is \(-\text{O} - \text{C} \) \(\text{C}_3\text{C}_4\)alkyl include those shown in Table 1:

**Table 1**

or a pharmaceutically acceptable salt thereof.

Another embodiment of this invention provides compounds of Formula I wherein R\textsuperscript{1} is \(-\text{C} \) \(\text{C}_3\text{C}_4\)alkyl which is optionally substituted with one or more deuterium atoms. In one aspect of this embodiment, R\textsuperscript{1} is \(-\text{CH}_3\), \(-\text{CD}_3\), \(-\text{CDH}_3\), \(-\text{CDCH}_3\), \(-\text{CD_3CH}_3\), \(-\text{CD_3CHCH}_3\), \(-\text{CDCH_3CHCH}_3\), \(-\text{CDCHCH_3CHCH}_3\), \(-\text{CD(CH}_3)_2\CHCH_3\), \(-\text{CD(CH}_3)_2\CH_2CH_3\), \(-\text{CDCH(CH}_3)_2\CHCH_3\), \(-\text{CDCH_3CH_2CH_3}\), and \(-\text{CDCH(CH}_3)_2\CH_2CH_3\).

In another aspect, R\textsuperscript{1} is \(-\text{CH}_3\), \(-\text{CH_3CH}_3\), and \(-\text{CH(CH}_3)_2\) \(\text{CH}_3\), or \(-\text{CHCH_3(CH}_3)_2\) \(\text{CH}_3\). Each of these aspects of R\textsuperscript{1} may be combined with the below aspects of R\textsuperscript{2} to provide further embodiments of this invention.

Another embodiment of this invention provides compounds of Formula I wherein R\textsuperscript{1} is a deuterated \(-\text{C} \) \(\text{C}_3\text{C}_4\) alkyl and wherein R\textsuperscript{2} is \(-\text{CH}_3\) or \(-\text{CD}_3\). In one aspect of this embodiment, R\textsuperscript{1} is \(-\text{CH}_3\). In another aspect, R\textsuperscript{1} is \(-\text{CD}_3\).

Examples of specific compounds of Formula I where R\textsuperscript{1} is \(-\text{C} \) \(\text{C}_3\text{C}_4\)alkyl include Compounds 108, 109 and 110 shown below.
In some embodiments, a compound of Formula I is "substantially free of" other isotopologues of the compound, e.g., less than 49.9%, less than 25%, less than 10%, less than 5%, less than 2%, less than 1%, or less than 0.5% of other isotopologues are present.

The synthesis of compounds of Formula I can be readily achieved by reference to the Exemplary Syntheses and Examples disclosed herein, and by use of procedures and intermediates analogous to those disclosed, for instance, in Schneider, O. & Grussner, A., Helv. Chim. Acta., 1951, 34: 2211; Grussner, A. & Schneider, O.; GB 713146 (1954); Toyo Pharma K. K., Japan JP 60089474 A (1983); Newman, A. H. et al., J. Med. Chem., 1992, 35: 4135. Such methods can be carried out by utilizing corresponding deuterated and, optionally, other isotope-containing reagents and/or intermediates to synthesize the compounds delineated herein, or by invoking standard synthetic protocols known in the art for introducing isotopic atoms to a chemical structure.

Exemplary Syntheses

The following deuterated reagents and building blocks which may be of use in preparing compounds of Formula I are commercially available: iodoethane-d₅, ethyl-2,2,2-d₃ iodide, ethyl-1,1-d₂ iodide, isopropyl-d₇ iodide, isopropyl-d₇ bromide, isopropyl-1,1,1,3,3,3-d₆ iodide, and 1,1,1,3,3,3-d₆ bromide.

A convenient method for synthesizing compounds of Formula I wherein R₁ is —O—(C₂-C₄)alkyl is depicted in Scheme 1.

Scheme 1. Synthesis of a Compound of Formula I (R₁ is —O—(C₂-C₄)alkyl)

Treatment of the known 17-ethoxycarbonyl-3-methoxy-morphinan (10) (for its preparation, see: Murdter, T. E. et al., Journal of Labelled Compounds and Radiopharmaceuticals 2002, 45: 1153-1158) with boron tribromide according to the procedure described by Newman, A. H. et al., Journal of Medicinal Chemistry 1992, 35: 4135-4142, affords the 17-ethoxycarbonyl-3-hydroxy-morphinan (11). Treatment of the 3-hydroxy-morphinan 11 with the appropriately deuterated alkyl iodoide in the presence of potassium carbonate in a manner analogous to the procedure described in the aforementioned paper gives the deuterated 17-ethoxycarbonyl-3-alkoxy-morphinans (12). Reduction of the carbamate of the morphinan 12 with either lithium aluminum hydride or lithium aluminum deuteride in THF in a manner analogous to that described by Newman affords the deuterated 3-alkoxy-17-methyl-morphinan (13) or the 3-alkoxy-17-trideuteromethyl-morphinan (14) compounds of Formula I, respectively.

A convenient method for synthesizing compounds of Formula I wherein R¹ is —(C₂-C₄)alkyl is depicted in Scheme 2.

Scheme 2. Synthesis of a Compound of Formula I (R¹ is —(C₂-C₄)alkyl)
Treatment of 17-ethoxycarbonyl-3-hydroxy-morphinan (11) with N-Phenyl-trifluoromethanesulfonimide according to the procedure described by Kim, C.-H. in US 2005/0256147 A1 affords the corresponding phenolic triflate (15). Palladium catalyzed cross-coupling of 15 with the appropriately deuterated (C\textsubscript{1}-C\textsubscript{4})alkyl boronic acid (16) in a manner analogous to the procedure from the aforementioned patent gives the deuterated 17-ethoxycarbonyl-3-(C\textsubscript{1}-C\textsubscript{4})alkyl-morphinan compounds (17). Reduction of the carbamate of morphinan 17 with either lithium aluminum hydride or lithium aluminum deuteride in THF in a manner analogous to the procedure described by Newman, A. H. et al., Journal of Medicinal Chemistry 1992, 35: 4135-4142 affords the deuterated 3-(C\textsubscript{1}-C\textsubscript{4})alkyl-17-methyl-morphinan or the 3-(C\textsubscript{1}-C\textsubscript{4})alkyl-17-trideuteromethyl-morphinan compounds of Formula I, respectively.

Scheme 3. Synthesis of Alkylboronic Ester 16

\[
\begin{align*}
(C_\text{1}-C_\text{4} \text{ alkyl})-X & \xrightarrow{\text{Li}(0) \text{ pentane}} (C_\text{1}-C_\text{4} \text{ alkyl})-\text{Li} \\
\text{X} & \xrightarrow{\text{HCl, H}_2\text{O}} (C_\text{1}-C_\text{4} \text{ alkyl})-\text{B(OH)}_2
\end{align*}
\]

Treatment of appropriately deuterated (C\textsubscript{1}-C\textsubscript{4})alkyl halide (20) with elemental lithium in pentane in a manner analogous to the procedure described by Dawildowski, D. et al., in WO 2005/082911 A1 affords the corresponding (C\textsubscript{1}-C\textsubscript{4})alkyl lithium anion, which may be immediately treated with tris(isopropyl) borate followed by hydrolysis with aqueous hydrogen chloride in a manner analogous to the procedure described by Brown, H. C. et al., Organometallics 1985, 4: 816-821 to afford the appropriately deuterated (C\textsubscript{1}-C\textsubscript{4})alkyl boronic acids (16).

The specific approaches and compounds shown above are not intended to be limiting. The chemical structures in the schemes herein depict variables that are hereby defined commensurately with chemical group definitions (moieties, atoms, etc.) of the corresponding position in the compound formulae herein, whether identified by the same variable name (i.e., R\textsubscript{1} or R\textsubscript{2}) or not. The suitability of a chemical group in a compound structure for use in the synthesis of another compound is within the knowledge of one of ordinary skill in the art. Additional methods of synthesizing compounds of Formula I and their synthetic precursors, including those within routes not explicitly shown in schemes herein, are within the means of chemists of ordinary skill in the art. Synthetic chemistry transformations and protecting group methodologies (protection and deprotection) useful in synthesizing the applicable compounds are known in the art and include, for example, those described in Larock R, Comprehensive Organic Transformations, VCH Publishers (1989); Greene T W et al., Protective Groups in Organic Synthesis, 3rd Ed., John Wiley and Sons (1999); Fieser L et al., Fieser and Fieser’s Reagents for Organic Synthesis, John Wiley and Sons (1994); and Paquette L. ed., Encyclopedia of Reagents for Organic Synthesis, John Wiley and Sons (1995) and subsequent editions thereof.

Combinations of substituents and variables envisioned by this invention are only those that result in the formation of stable compounds.

Compositions

The invention also provides pyrogen-free compositions comprising a compound of Formula I (e.g., including any of the formulae herein), or a pharmaceutically acceptable salt of said compound; and an acceptable carrier. In one embodiment, the composition comprises an effective amount of the compound or pharmaceutically acceptable salt thereof, and an acceptable carrier. In one embodiment, the composition comprises an effective amount of the compound or pharmaceutically acceptable salt thereof. Preferably, a composition of this invention is formulated for pharmaceutical use ("a pharmaceutical composition"), wherein the carrier is a pharmaceutically acceptable carrier. The carrier is "acceptable" in the sense of being compatible with the other ingredients of the formulation and, in the case of a pharmaceutically acceptable carrier, not deleterious to the recipient thereof in an amount used in the medicament.

Pharmaceutically acceptable carriers, adjuvants and vehicles that may be used in the pharmaceutical compositions of this invention include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins,
such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, polyethylene glycol and wool fat.

If required, the solubility and bioavailability of the compounds of the present invention in pharmaceutical compositions may be enhanced by methods well-known in the art. One method includes the use of lipid excipients in the formulation. See “Oral Lipid-Based Formulations: Enhancing the Bioavailability of Poorly Water-Soluble Drugs (Drugs and the Pharmaceutical Sciences),” David J. Hauss, ed. Informa Healthcare, 2007; and “Role of Lipid Excipients in Modifying Oral and Parenteral Drug Delivery: Basic Principles and Biological Examples,” Kishor M. Wasan, ed. Wiley-InterScience, 2006.

Another known method of enhancing bioavailability is the use of an amorphous form of a compound of this invention optionally formulated with a poloxamer, such as LUTROL™ and PLURONIC™ (BASF Corporation), or block copolymers of ethylene oxide and propylene oxide. See U.S. Pat. No. 7,014,866; and United States patent publications 20060094744 and 20060079502.

The pharmaceutical compositions of the invention include those suitable for oral, rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration. In certain embodiments, the compound of the formulae herein is administered transdermally (e.g., using a transdermal patch or iontophoretic techniques). Other formulations may conveniently be presented in unit dosage form, e.g., a gelatin capsule can be useful for containing such suspensions, which may beneficially increase the rate of compound absorption. In the case of tablets for oral use, carriers that are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added.

For oral administration in a capsule form, useful diluents and/or fillers include lactose and dried cornstarch. When aqueous suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added.

Compositions suitable for oral administration include lozenges comprising the ingredients in a flavored basis, usually sucrose and acacia or tragacanth; and pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia.

Compositions suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example, sealed ampules and vials, and may be stored in a freeze dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets.

Such injection solutions may be in the form, for example, of a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butandiol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer’s solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant.

The pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These compositions may be prepared by mixing a compound of this invention with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art. See, e.g.: Rabinowitz J D and Zaffaroni A C, U.S. Pat. No. 6,803,031, assigned to Alexza Molecular Delivery Corporation.

Topical administration of the pharmaceutical compositions of this invention is especially useful when the desired treatment involves areas or organs readily accessible by topical application. For topical application topically to the skin, the pharmaceutical composition should be formulated with a suitable ointment containing the active components suspended or dissolved in a carrier. Carriers for topical admini
According to another embodiment, the invention provides a method of coating an implantable medical device comprising the step of contacting said device with the coating composition described above. It will be obvious to those skilled in the art that the coating of the device will occur prior to implantation into a mammal.

According to another embodiment, the invention provides a method of impregnating an implantable drug release device comprising the step of contacting said drug release device with a compound or composition of this invention. Implantable drug release devices include, but are not limited to, biodegradable polymer capsules or bullets, non-degradable, diffusible polymer capsules and biodegradable polymer wafers.

According to another embodiment, the invention provides an implantable medical device coated with a compound or composition comprising a compound of this invention, such that said compound is released from said device and is therapeutically active.

According to another embodiment, the invention provides an implantable drug release device impregnated with or containing a compound or composition comprising a compound of this invention, such that said compound is released from said device and is therapeutically active.

Where an organ or tissue is accessible because of removal from the subject, such organ or tissue may be bathed in a medium containing a composition of this invention, a composition of this invention may be painted onto the organ, or a composition of this invention may be applied in any other convenient way.

In one embodiment, an effective amount of a compound of this invention can range from 0.4 mg to 400 mg, from 4.0 mg to 350 mg, from 10 mg to 90 mg, or from 30 mg to 45 mg, inclusive, which can be given once, twice, or up to three times daily depending on various factors recognized by those skilled in the art.

Effective doses will also vary, as recognized by those skilled in the art, depending on the diseases treated, the severity of the disease, the route of administration, the sex, age and general health condition of the subject, the excipient usage, the possibility of co-usage with other therapeutic treatments such as use of other agents and the judgment of the treating physician. For example, guidance for selecting an effective dose can be determined by reference to the prescribing information for dextromethorphan.

For pharmaceutical compositions that comprise a second therapeutic agent, an effective amount of the second therapeutic agent is between about 0.01% to 100% of the dosage normally utilized in a monotherapy regime using just that agent. The normal monotherapeutic dosages of these second therapeutic agents are well known in the art. See, e.g., Wells et al., eds., Pharmacotherapy Handbook, 2nd Edition, Appleton and Lange, Stamford, Conn. (2000); PDR Pharmacopoeia, Tarasco Pocket Pharmacopoeia 2000, Deluxe Edition, Tarasco Publishing, Loma Linda, Calif. (2000), each of which references are incorporated herein by reference in their entirety.

It is expected that some of the second therapeutic agents referred to above will act synergistically with the compounds of this invention. When this occurs, it will allow the effective dosage of the second therapeutic agent and/or the compound of this invention to be reduced from that required in a monotherapy. This has the advantage of minimizing toxic side effects of either the second therapeutic agent of a compound of this invention, synergistic improvements in efficacy, improved ease of administration or use and/or reduced overall expense of compound preparation or formulation.

Methods of Treatment

In another embodiment, the invention provides a method of modulating the activity of the sigma-1 and sigma-2 receptor, N-methyl-D-aspartate (NMDA), or the activity of the NMDA nicotinic receptor in a cell, comprising contacting a cell with one or more compounds of Formula I.

In another embodiment, the invention provides a method of inhibiting neurotransmitters, such as glutamate, from activating receptors in the brain and/or inhibiting the uptake of dopamine and serotonin by administering a compound of Formula I.

According to another embodiment, the invention provides a method of treating a subject suffering from, or susceptible to, a disease or condition that is beneficially treated by dextromethorphan comprising the step of administering to said subject an effective amount of a compound of Formula I or a pharmaceutically acceptable salt thereof or a composition comprising such compound. Such diseases and conditions are well known in the art and are disclosed in, but not limited to, those described in U.S. Pat. Nos. 4,316,888; 4,446,140; 4,694,010; 4,898,860; 5,166,207; 5,336,980; 5,350,756; 5,863,927; 6,012,978; 6,012,979; 6,166,510; 6,279,785; 6,301,458; 6,344,693; 6,366,980; 6,427,908; 6,429,761; 6,436,904; 6,441,651; 6,446,140; 6,464,537; 6,472,616; 6,475,164; 6,538,152; and 7,114,547, as well as in US patent publications 2001/0044446; 2002/0103109; 2004/0087479; 2005/0129783; 2005/0203125; and 2007/0191411.

Such diseases and conditions include, but are not limited to, emotional lability; pseudobulbar affect; autism; neurological disorders and neurodegenerative diseases, such as, e.g., dementia, amyotrophic lateral sclerosis (ALS, also known as Lou Gehrig's disease), Alzheimer's disease, and multiple sclerosis; disturbances of consciousness disorders; cardiovascular diseases, such as, e.g., peripheral vascular diseases, strokes, myocardial infarctions, and atherosclerosis; glaucoma, tardive dyskinesia; diabetic neuropathy; retinopathy diseases; diseases or disorders caused by homocysteine-induced apoptosis; diseases or disorders caused by elevated levels of homocysteine; pain, including but not limited to, chronic pain; intractable pain; neuropathic pain, sympathetically mediated pain, such as, alldynia, hyperpathia, hyperalgesia, dysesthesia, deafferentation pain, and anesthesia dolorosa; pain associated with gastrointestinal dysfunction, including, e.g., irritable bowel syndrome; and mouth pain; epileptic seizures; tinnitus; sexual dysfunction; intractable coughing; dermatitis; addiction disorders, such as, e.g., addiction to or dependence on stimulants, nicotine, morphine, heroin, other opiates, amphetamines, cocaine, and alcohol; Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; fatigue caused by cancer; and conditions related to exposure to chemical agents.

In one particular embodiment, the method of this invention is used to treat a subject suffering from or susceptible to a disease or condition selected from diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

In one particular embodiment, the method is used to treat a subject suffering from or susceptible to a disease or condition selected from diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

In another particular embodiment, the method is used to treat a subject suffering from or susceptible to a disease or condition selected from diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

In another particular embodiment, the method is used to treat a subject suffering from or susceptible to a disease or condition selected from diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

In another particular embodiment, the method is used to treat a subject suffering from or susceptible to a disease or condition selected from diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including, e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

Methods delineated herein also include those wherein the subject is identified as in need of a particular stated treatment. Identifying a subject in need of such treatment can be in the judgment of a subject or a health care professional and can be subjective (e.g. opinion) or objective (e.g. measurable by a test or diagnostic method).

In another embodiment, any of the above methods of treatment comprises the further step of co-administering to the subject one or more additional second therapeutic agents. The choice of second therapeutic agent may be made from any second therapeutic agent known to be useful for co-administration with dextromethorphan. The choice of second therapeutic agent is also dependent upon the particular disease or condition to be treated. Examples of second therapeutic agents that may be employed in the methods of this invention are those set forth above for use in combination compositions comprising a compound of this invention and a second therapeutic agent.

In particular, the combination therapies of this invention include co-administering to a subject in need thereof a compound of Formula I or pharmaceutically acceptable salt thereof, or a composition comprising such compound or salt;
and quinidine sulfate wherein the subject is suffering from or susceptible to diabetic neuropathy.

In another embodiment the invention provides a method of treating a subject suffering from non-small cell lung cancer or malignant pleural mesothelioma by co-administering to the subject in need thereof a compound of Formula I, or a composition comprising such compound; and LB1589.

The term “co-administered” as used herein means that the additional second therapeutic agent may be administered together with a compound of this invention as part of a single dosage form (such as a composition of this invention comprising a compound of the invention and an second therapeutic agent as described above) or as separate, multiple dosage forms. Alternatively, the additional agent may be administered prior to, consecutively with, or following the administration of a compound of this invention. In such combination therapy treatment, both the compounds of this invention and the second therapeutic agent(s) are administered by conventional methods. The administration of a composition of this invention, comprising both a compound of the invention and a second therapeutic agent, to a subject does not preclude the separate administration of that same therapeutic agent, any other second therapeutic agent or any compound of this invention to said subject at another time during a course of treatment.

Effective amounts of these second therapeutic agents are well known to those skilled in the art and guidance for dosing may be found in patents and published patent applications referenced herein, as well as in Wells et al., eds., Pharmacotherapy Handbook, 2nd Edition, Appleton and Lange, Stamford, Conn. (2000); PDR Pharmacopoeia, Tarascon Pocket Pharmacopoeia 2000, Deluxe Edition, Tarascon Publishing, Loma Linda, Calif. (2000), and other medical texts. However, it is well within the skilled artisan’s purview to determine the second therapeutic agent’s optimal effective-amount range.

In one embodiment of the invention, where a second therapeutic agent is administered to a subject, the effective amount of the compound of this invention is less than its effective amount would be where the second therapeutic agent is not administered. In another embodiment, the effective amount of the second therapeutic agent is less than its effective amount would be where the compound of this invention is not administered. In this way, undesired side effects associated with high doses of either agent may be minimized. Other potential advantages (including without limitation improved dosing regimens and/or reduced drug cost) will be apparent to those of skill in the art.

In yet another aspect, the invention provides the use of a compound of Formula I alone or together with one or more of the above-described second therapeutic agents in the manufacture of a medicament, either as a single composition or as separate dosage forms, for treatment or prevention in a subject of a disease, disorder or symptom set forth above. Another aspect of the invention is a compound of Formula I for use in the treatment or prevention in a subject of a disease, disorder or symptom thereof delineated herein.

Diagnostic Methods and Kits

The compounds and compositions of this invention are also useful as reagents in methods for determining the concentration of dextromethorphan in solution or biological sample such as plasma, examining the metabolism of dextromethorphan and other analytical studies.

According to one embodiment, the invention provides a method of determining the concentration, in a solution or a biological sample, of a non-deuterated analog of a compound of Formula I, comprising the steps of:

1. adding a known concentration of a compound of Formula I to the solution of biological sample;
2. subjecting the solution or biological sample to a measuring device that distinguishes the corresponding non-deuterated analog from a compound of Formula I;
3. calibrating the measuring device to correlate the detected quantity of the compound of Formula I with the known concentration of the compound of Formula I added to the biological sample or solution; and
4. measuring the quantity of the corresponding non-deuterated analog in the biological sample with said calibrated measuring device; and
5. determining the concentration of the corresponding non-deuterated analog in the solution of sample using the correlation between detected quantity and concentration obtained for a compound of Formula I.

Measuring devices that can distinguish the corresponding non-deuterated analog from a compound of Formula I include any measuring device that can distinguish between two compounds that differ from one another in isotopic abundance. Exemplary measuring devices include a mass spectrometer, NMR spectrometer, or IR spectrometer.

In another embodiment, a method for determining the amount of a non-deuterated analog of a compound of Formula I in a solution or a biological sample is provided, comprising:

1. adding a known amount of a compound of Formula I to the solution or biological sample;
2. detecting at least one signal for a compound of Formula I and at least one signal for the corresponding non-deuterated analog in a measuring device that is capable of distinguishing the two compounds;
3. correlating the at least one signal detected for a compound of Formula I with the known amount of the compound of Formula I added to the solution or the biological sample; and
4. determining the amount of the corresponding non-deuterated analog in the solution or biological sample using the correlation between the at least one signal detected of the compound of Formula I and the amount added to the solution or biological sample of a compound of Formula I.

In another embodiment, the invention provides a method of evaluating the metabolic stability of a compound of Formula I comprising the steps of contacting the compound of Formula I with a metabolizing enzyme source for a period of time and comparing the amount of the compound of Formula I with the metabolic products of the compound of Formula I after the period of time.

In a related embodiment, the invention provides a method of evaluating the metabolic stability of a compound of Formula I comprising the steps of contacting the compound of Formula I with a membrane or cell monolayer for a period of time and comparing the amount of the compound of Formula I with the metabolic products of the compound of Formula I after the period of time.

The present invention also provides kits for use to treat pseudobulbar disorder, diabetic neuropathy, Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including e.g., adductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer. These kits comprise (a) a pharmaceutical composition comprising a compound of Formula I or a salt thereof, wherein said pharmaceutical composition is in a con-
and (b) instructions describing a method of using the pharmaceutical composition to treat pseudobulbar affect; diabetic neuropathy; Rett syndrome (RTT); voice disorders due to uncontrolled laryngeal muscle spasms, including e.g., abductor spasmodic dysphonia, adductor spasmodic dysphonia, muscular tension dysphonia, and vocal tremor; methotrexate neurotoxicity; and fatigue caused by cancer.

The container may be any vessel or other sealed or sealable apparatus that can hold said pharmaceutical composition. Examples include bottles, ampules, divided or multi-chambered holders bottles, wherein each division or chamber comprises a single dose of said composition, a divided foil packet wherein each division comprises a single dose of said composition, or a dispenser that dispenses single doses of said composition. The container can be in any conventional shape or form as known in the art which is made of a pharmaceutically acceptable material, for example a paper or cardboard box, a glass or plastic bottle or jar, a re-sealable bag (for example, to hold a "refill" of tablets for placement into a different container), or a blister pack with individual doses for pressing out of the pack according to a therapeutic schedule. The container employed can depend on the exact dosage form involved, for example a conventional cardboard box would not generally be used to hold a liquid suspension. It is feasible that more than one container can be used together in a single package to market a single dosage form. For example, tablets may be contained in a bottle, which is in turn contained within a box. In an embodiment, the container is a blister pack.

The kits of this invention may also comprise a device to administer or to measure out a unit dose of the pharmaceutical composition. Such device may include an inhaler if said composition is an inhalable composition; a syringe and needle if said composition is an injectable composition; a syringe, spoon, pump, or a vessel with or without volume markings if said composition is an oral liquid composition; or any other measuring or delivery device appropriate to the dosage formulation of the composition present in the kit.

In an embodiment of the kits of this invention, the composition comprising the second active agent may be in a vessel or container that is separate from the vessel containing the composition comprising a compound of Formula I.

**EXAMPLES**

**Example 1**

Synthesis of (+)-3-(Ethoxy-d5)-17-(methyl-d3)-(9α, 13α,14α)-morphinan hydrochloride (100)

Compound 100 was prepared as outlined below. Details of the synthesis follow.
26

Synthesis of (+)-17-ethylcarbamate-3-hydroxy-(9α, 13α,14α)-morphinan (11)

In a reaction vessel fit with a stir bar the carbamate 10 (2.43 g, 7.4 mmol) was dissolved in CH2Cl2 (20 mL) and the resulting solution was cooled to 0°C. BBr3 (9.24 g, 36.9 mmol) was added and the reaction mixture was stirred under an atmosphere of N2 for 20 min (at which time TLC in 20% ethylacetate/hexane showed the reaction to be complete). A solution of 27% NH4OH in ice was placed in a beaker with a stir bar and the reaction mixture was slowly added with stirring. The resulting mixture was stirred for 20 min then was extracted with 4:1 CHCl3/CH3OH (200 mL).

The organic layer was dried over Na2SO4, filtered, then concentrated on a rotary evaporator. The crude material was purified via automated flash column chromatography (CH3OH with 1% NH4OH/CHCl3, 0-10%). The pure fractions were concentrated on a rotary evaporator to yield 1.48 g of 11 as a white solid.

1H-NMR (300 MHz, CDCl3): δ 1.04-1.12 (dd, J2=24.7, J3=12.6, J4=3.8, 1H), 1.23-1.43 (m, 5H), 1.49-1.52 (m, 1H), 1.62-1.65 (m, 1H), 1.72 (td, J2=12.6, J3=4.9, 1H), 1.81 (dt, J1=12.6, J2=3.3, 1H), 2.07 (td, J1=12.6, J2=3.3, 1H), 2.33-2.47 (m, 5H), 2.57 (dd, J1=18.1, J2=5.5, 1H), 2.79 (dd, J1=25.9, J2=5.5, J3=3.3, 1H), 2.98 (d, J=18.1, 1H), 6.68 (dd, J1=8.2, J2=2.7, 1H), 6.80 (d, J=2.7, 1H), 7.02 (d, J=8.2, 1H).

Synthesis of (+)-3-(ethoxy-d5)-17-(methyl-d3)-(9α, 13α,14α)-morphinan (20)

To a solution of alcohol 11 (1.50 g, 4.8 mmol) in DME (25 mL), was added K2CO3 (2.00 g, 14.5 mmol, 3.05 eq) and iodoethane-d5 (1.15 g, 7.1 mmol, 1.50 eq) with stirring. The reaction mixture was stirred overnight at room temperature (rt) under an atmosphere of N2, was quenched by the addition of H2O, and extracted with Et0Ac (5x30 mL). The combined organic fractions were dried over Na2SO4, filtered and concentrated in vacuo to a yellow oil. Purification via automated flash column chromatography (0-40% Et0Ac/hexanes) afforded intermediate 20 (1.53 g, 91% yield).

1H-NMR (300 MHz, CDCl3): δ 1.04-1.12 (m, 1H), 1.22-1.36 (m, 7H), 1.45-1.59 (m, 3H), 1.63-1.67 (m, 2H), 2.30-2.33 (m, 1H), 2.52-2.66 (m, 2H), 3.06 (dd, J1=18.4, J2=5.9, 1H), 3.84 (ddd, J1=35.8, J2=13.8, J3=6.1, 1H), 4.10-4.18 (m, 2H), 4.31 (dt, J1=53.9, J2=3.1, 1H), 6.64 (m, 1H), 6.78 (s, 1H), 6.93 (apparent t, J=7.8, 1H).

Synthesis of (+)-3-(ethoxy-d5)-17-ethylcarbamate-3-methoxy-(9α, 13α,14α)-morphinan (9)

To a reaction vessel with CHCl3 and a stir bar K2CO3 (13.85 g, 100.2 mmol) was added and the mixture was stirred at RT under an atmosphere of N2 for 10 min before the addition of acetyl chloride (7.866 g, 100.2 mmol). The resulting mixture, still under an atmosphere of N2, was quenched by the addition of magnesium sulfate heptahydrate, filtered, then concentrated in vacuo to a yellow oil. Purification via automated flash column chromatography (CH3OH with 1% NH4OH/CHCl3, 0-10%). The pure fractions were concentrated on a rotary evaporator to yield 1.48 g of 11 as a white solid.

1H-NMR (300 MHz, CDCl3): δ 1.04-1.12 (m, 1H), 1.22-1.36 (m, 7H), 1.45-1.59 (m, 3H), 1.63-1.67 (m, 2H), 2.30-2.33 (m, 1H), 2.52-2.66 (m, 2H), 3.06 (dd, J1=18.4, J2=5.9, 1H), 3.84 (ddd, J1=35.8, J2=13.8, J3=6.1, 1H), 4.10-4.18 (m, 2H), 4.31 (dt, J1=53.9, J2=3.1, 1H), 6.64 (m, 1H), 6.78 (s, 1H), 6.93 (apparent t, J=7.8, 1H).
Example 3

Synthesis of (+)-3-(Isopropoxy-d$_7$)-17-(methyl-d$_3$)-(9α,13α,14α)-morphinan (102)

Compound 102 was prepared as outlined below. Details of the synthesis follow.

Synthesis of (+)-3-(isopropoxy-d$_7$)-17-(methyl-d$_3$)-(9α,13α,14α)-morphinan (102)

To a slurry of LiAlD$_4$ (0.340 g, 8.1 mmol, 4.0 eq) in THF (10 mL) stirring at -78° C. was added a solution of the carbamate 21 (0.739 g, 2.0 mmol) in THF (5 mL). The reaction mixture was stirred overnight at rt, then was quenched by the addition of magnesium sulfate heptahydrate until cessation of gas evolution. The mixture was filtered, the filtrate concentrated in vacuo and the resultant material was dissolved in CH$_3$OH. The resulting solution was acidified to pH 3.00 min, purity: 95%. MS (M+H): 294.2.

Synthesis of (+)-3-(Ethoxy-d$_5$)-17-methyl-(9α,13α,14α)-morphinan hydrochloride (104)

Compound 104 was prepared as outlined in Example 1 above with the exception that LiAlH$_4$ was used in place of LiAlD$_4$ for the reduction of the carbamate 20 to 104.

Example 2

Synthesis of (+)-3-(Ethoxy-d$_5$)-17-methyl-(9α,13α,14α)-morphinan hydrochloride (104)

To a slurry of LiAlH$_4$ (0.166 g, 4.4 mmol, 2.0 eq) in THF (10 mL) stirring at -78° C. was added a solution of the carbamate 20 (0.763 g, 2.2 mmol) in THF (5 mL). After 1 han additional 2.0 eq of LiAlH$_4$ (0.184 g, 4.4 mmol, 2.0 eq) was added. The reaction mixture was stirred overnight at rt, then was quenched by the addition of magnesium sulfate heptahydrate until cessation of gas evolution. The mixture was filtered, concentrated in vacuo and the resultant material was purified via automated flash column chromatography (CHCl$_3$/CH$_3$OH/NH$_3$OH—90/10/1) to yield the free-amine 104. This material was dissolved in 1.25 Μ HC1 in CH$_3$OH then was concentrated under reduced pressure and dried under high vacuum to yield 31 mg of product 104 as the HC1 salt.

Synthesis of (+)-3-(Ethoxy-d$_5$)-17-methyl-(9α,13α,14α)-morphinan hydrochloride (104)

To a solution of alcohol 11 (1.50 g, 4.8 mmol; produced according to Example 1) in DMF (25 mL), was added K$_2$CO$_3$ (2.00 g, 14.5 mmol, 3.05 eq) and 2-iodopropane-d$_7$ (0.71 mL, 7.1 mmol, 1.50 eq) with stirring. The reaction mixture was stirred overnight at room temperature (rt) under an atmosphere of N$_2$, was quenched by the addition of H$_2$O, and extracted with Et$_2$O (3x30 mL). The combined organics were dried over Na$_2$SO$_4$, filtered and concentrated in vacuo to a colorless oil. Purification via automated flash column chromatography (0-40% EtOAc/hexanes) afforded intermediate 21 (1.48 g, 85% yield).

Synthesis of (+)-3-(isopropoxy-d$_7$)-17-ethoxycarbonyl-(9α,13α,14α)-morphinan (21)

To a solution of alcohol 11 (1.50 g, 4.8 mmol; produced according to Example 1) in DMF (25 mL), was added K$_2$CO$_3$ (2.00 g, 14.5 mmol, 3.05 eq) and 2-iodopropane-d$_7$ (0.71 mL, 7.1 mmol, 1.50 eq) with stirring. The reaction mixture was stirred overnight at room temperature (rt) under an atmosphere of N$_2$, was quenched by the addition of H$_2$O, and extracted with Et$_2$O (3x30 mL). The combined organics were dried over Na$_2$SO$_4$, filtered and concentrated in vacuo to a colorless oil. Purification via automated flash column chromatography (0-40% EtOAc/hexanes) afforded intermediate 21 (1.48 g, 85% yield).

Synthesis of (+)-3-(isopropoxy-d$_7$)-17-ethoxycarbonyl-(9α,13α,14α)-morphinan (21)

To a solution of alcohol 11 (1.50 g, 4.8 mmol; produced according to Example 1) in DMF (25 mL), was added K$_2$CO$_3$ (2.00 g, 14.5 mmol, 3.05 eq) and 2-iodopropane-d$_7$ (0.71 mL, 7.1 mmol, 1.50 eq) with stirring. The reaction mixture was stirred overnight at room temperature (rt) under an atmosphere of N$_2$, was quenched by the addition of H$_2$O, and extracted with Et$_2$O (3x30 mL). The combined organics were dried over Na$_2$SO$_4$, filtered and concentrated in vacuo to a colorless oil. Purification via automated flash column chromatography (0-40% EtOAc/hexanes) afforded intermediate 21 (1.48 g, 85% yield).
Example 4

Synthesis of (+)-3-(Isopropoxy-d7)-17-methyl-(9α, 13α, 14α)-morphinan (106)

Compound 106 was prepared as outlined in Example 3 above with the exception that LiAlH₄ was used in place of LiAlD₄ for the reduction of the carbamate 21 to 106.

Example 5

Synthesis of (+)-3-(Methyl-d3)-17-methyl-(9α, 13α, 14α)-morphinan (108)

To a slurry of LiAlH₄ (0.308 g, 8.1 mmol, 4.0 eq) in THF (10 mL) stirring at -78°C was added a solution of the carbamate 21 (0.739 g, 2.0 mmol) in THF (5 mL). The reaction mixture was stirred overnight at rt, then was quenched by the addition of magnesium sulfate heptahydrate until cessation of gas evolution. The mixture was filtered, the filtrate concentrated in vacuo and the resultant material was dissolved in CH₃OH. The resulting solution was acidified to pH 4 with fumaric acid resulting in salt precipitation. The mixture was stirred for 5 min, and Et₂O was added to bring remaining salt out of solution. The salt was isolated by filtration and dried to yield 660 mg of final product 102 as the fumaric acid salt.

H-NMR (300 MHz, CDCl₃): δ 1.10 (qd, J₁=12.6, J₂=3.8, 1H), 1.12-1.68 (m, 7H), 2.01 (td, J₁=13.6, J₂=4.5, 1H), 2.16-2.21 (m, 1H), 2.32-2.47 (m, 2H), 2.99-3.01 (m, 2H), 3.10-3.13 (m, 1H), 3.44-3.46 (m, 1H), 6.72 (dd, J₁=8.4, J₂=4.1, 1H), 6.79 (d, J=2.5, 1H), 6.82 (s, 1H), 7.03 (d, J=8.3, 1H).

HPLC (method: 150 mm C18-RP column-gradient method 5-95% ACN; Wavelength: 280 nm): retention time: 3.11 min, purity: 95%. MS (M+H): 310.3.

Synthesis of (+)-3-(Methyl-d3)-17-methyl-(9α, 13α, 14α)-morphinan (108)

To a solution of 11 (9 g, 28.6 mmol, see Example 1) and triethylamine (16 mL, 114 mmol) in CH₂Cl₂ (400 mL) was added N-phenyl-trifluoromethanesulfonylimide “PhNTf₂” (20.7 g, 57.2 mmol) with cooling in an ice-bath. The reaction mixture was allowed to warm to ambient temperature and was stirred overnight. The mixture was diluted with CH₂Cl₂ (500 mL) and the solution was washed with saturated sodium bicarbonate, water, and brine, then dried over sodium sulfate.

Synthesis of (+)-3-(Methyl-d₃)-17-methyl-(9α, 13α, 14α)-morphinan (108)

To a solution of 11 (9 g, 28.6 mmol, see Example 1) and triethylamine (16 mL, 114 mmol) in CH₂Cl₂ (400 mL) was added N-phenyl-trifluoromethanesulfonylimide “PhNTf₂” (20.7 g, 57.2 mmol) with cooling in an ice-bath. The reaction mixture was allowed to warm to ambient temperature and was stirred overnight. The mixture was diluted with CH₂Cl₂ (500 mL) and the solution was washed with saturated sodium bicarbonate, water, and brine, then dried over sodium sulfate.
After filtration and concentration under reduced pressure, the crude product was purified by column chromatography on silica gel (ethyl acetate/heptanes, 0-10%) to afford 12 g (94%) of 22 as clear oil.

Synthesis of (+)-17-ethylcarbamate-3-(methyl-d₃)-(9α,13α,14α)-morphinan (23)

To a solution of 22 (22 g, 43.8 mmol) in THF (500 mL) was added N-methyl-2-pyrrolidone “NMP” (26.2 mL, 153.1 mmol) at ambient temperature. The reaction mixture was degassed by N₂ purge for 10 minutes. Iron(III) acetylacetonate “Fe(acac)₃” (1.65 g, 4.4 mmol) and CD₃MgI (1M in Et₂O, 53 mL, 47.6 mmol, Sigma Aldrich, 99 atom % D) were added and the reaction mixture was heated to reflux overnight. The reaction was cooled and water (500 mL) was added. The layers were separated and the aqueous layer was extracted with CH₂Cl₂ (3x100 mL). The combined organics were washed with brine, dried over sodium sulfate, filtered, concentrated under reduced pressure and purified by column chromatography on silica gel (ethyl acetate/heptanes, 0-10%) to afford 4 g (94%, based on recovered starting material) of 23 and 16 g of recovered 22.

Synthesis of (+)-3-methyl-17-(methyl-d₃)-(9α,13α,14α)-morphinan (108)

A mixture of 23 (1.5 g, 4.8 mmol) in THF (70 mL) was treated with LiAlH₄ (1M in THF, 19.2 mL) at 0° C. The mixture was allowed to warm to ambient temperature and was stirred overnight. Water (1 mL) was added to quench the reaction, followed by NaOH (24%, 10 mL). The mixture was stirred for 30 minutes, during which time white solid precipitated. The solid was filtered and washed with MTBE (100 mL) to provide 1.2 g of solid. The material was recrystallized with MeOH/MTBE to provide 108 as the phosphate salt (0.75 g, 47%).

1H-NMR (300 MHz, CD₃OD): δ 1.07-1.57 (m, 8H), 1.69-1.72 (m, 2H), 2.56 (br.d., 1H), 2.91 (s, 3H), 3.06-3.11 (br. s. and m, 3H), 3.56 (br.m, 1H), 7.03-7.18 (m, 3H). HPLC (method: 20 mm C-18 RP column-gradient method 2-95% ACN/water/0.1% formic acid; Wavelength: 210 nm): retention time: 2.59 min, purity: 99.4%. MS (M+H): 259.2

Synthesis of (+)-17-ethylcarbamate-3-methyl-(9α,13α,14α)-morphan (24)

To a solution of 22 (3.6 g, 7.16 mmol, see Example 5) in THF (100 mL) was added N-methyl-2-pyrrolidone “NMP” (4.3 mL, 25.1 mmol) at ambient temperature. The reaction mixture was degassed by N₂ purge for 10 minutes. Iron(III) acetylacetonate “Fe(acac)₃” (270 mg, 0.72 mmol) and MeMgBr (3M in Et₂O, 2.9 mL, 7.8 mmol) were added and the reaction mixture was heated to reflux overnight. The reaction was cooled and water (50 mL) was added. The layers were separated and the aqueous layer was extracted with CH₂Cl₂ (3x100 mL). The combined organics were washed with brine, dried over sodium sulfate, filtered, concentrated under reduced pressure, and purified by column chromatography on silica gel (ethyl acetate/heptanes, 0-10%) to afford 0.84 g of 24 (75% based on recovered starting material) and 2 g of recovered 22.

Synthesis of (+)-3-Methyl-17-(methyl-d₃)-(9α,13α, 14α)-morphan (109)

To a solution of 22 (3.6 g, 7.16 mmol, see Example 5) in THF (100 mL) was added N-methyl-2-pyrrolidone “NMP” (4.3 mL, 25.1 mmol) at ambient temperature. The reaction mixture was degassed by N₂ purge for 10 minutes. Iron(III) acetylacetonate “Fe(acac)₃” (270 mg, 0.72 mmol) and MeMgBr (3M in Et₂O, 2.9 mL, 7.8 mmol) were added and the reaction mixture was heated to reflux overnight. The reaction was cooled and water (50 mL) was added. The layers were separated and the aqueous layer was extracted with CH₂Cl₂ (3x100 mL). The combined organics were washed with brine, dried over sodium sulfate, filtered, concentrated under reduced pressure, and purified by column chromatography on silica gel (ethyl acetate/heptanes, 0-10%) to give 0.84 g of 24 (75% based on recovered starting material) and 2 g of recovered 22.

Synthesis of (+)-3-methyl-17-(methyl-d₃)-(9α,13α, 14α)-morphan (109)

A mixture of 24 (1 g, 6.2 mmol) in THF (30 mL) was treated with LiAlD₄ (0.9 g, 24.8 mmol, Cambridge Isotopes, 98 atom % D) at 0° C. and the reaction was allowed to warm

Synthesis of (+)-3-Methyl-17-(methyl-d₃)-(9α,13α, 14α)-morphan (109)
At ambient temperature and stir overnight. Water (1 mL) was added to quench the reaction, followed by NaOH (24%, 5 mL). The mixture was filtered and the filtrate was concentrated under reduced pressure. The crude product was dissolved in EtOAc (30 mL) and extracted with 10% HCl (3x30 mL). The combined aqueous layer was washed with CH₂Cl₂ (30 mL) and neutralized with 10% NaOH. The aqueous layer was then extracted with CH₂Cl₂ (3x30 mL), the combined organics were dried over sodium sulfate, filtered and concentrated under reduced pressure to afford 109. The free amine was dissolved in MTBE (30 mL) and heated to reflux. H₃PO₄ (in isopropanol) was added dropwise, resulting in the formation of a white solid. The addition of H₃PO₄ was continued until no more white solid appeared to precipitate. The solid was filtered and washed with MeOH/MTBE to provide 110 as the phosphate salt (1 g, 36%).

**Example 7**

Synthesis of (+)-3-(Methyl-d₃)-17-(methyl-d₃)-(9α,13α,14α)-morphinan (110)

A mixture of 23 (2.5 g, 8 mmol, see Example 5) in THF (70 mL) was treated with LiAlD₄ (1.7 g, 32 mmol, Cambridge Isotopes, 98 atom % D) at 0°C. The mixture was allowed to warm to ambient temperature and was stirred overnight.

Water (1 mL) was added to quench the reaction, followed by NaOH (24%, 10 mL). The mixture was stirred for 30 minutes, during which time white solid precipitated. The solid was filtered and the filtrate was concentrated under reduced pressure. The crude product was purified by preparative HPLC (see conditions described in Example 5) to provide 110. The free amine was dissolved in MTBE (100 mL) and heated to reflux. H₃PO₄ (in isopropanol) was added dropwise, resulting in the formation of a white solid. The addition of H₃PO₄ was continued until no more white solid appeared to precipitate. The solid was filtered and washed with MTBE (100 mL) to provide 1.2 g of solid. The product was recrystallized in MeOH/MTBE to provide 110 as the phosphate salt (1 g, 36%).

**1H-NMR (300 MHz, CD₂OD): δ 1.09-1.13 (m, 1H), 1.24-1.33 (m, 1H), 1.39-1.72 (m, 6H), 1.95-2.04 (m, 1H), 2.16-2.18 (m, 1H), 2.50-2.54 (m, 1H), 2.60-2.68 (m, 1H), 3.07-3.16 (m, and s, 3H), 3.54-3.55 (m, 1H), 7.02-7.17 (m, 3H).

**13C-NMR (75 MHz, CD₂OD):** δ 20.2, 21.7, 25.8, 35.0, 35.8, 60.3, 125.8, 127.4, 128.0, 130.8, 137.2, 137.4. HPLC (method: 20 mm C18 RP column-gradient method 2-95% ACN/water/0.1% formic acid; Wavelength: 210 nm): retention time: 2.61 min., purity >99.9%. MS (M+H): 262.2.

**Example 8**

Evaluation of Metabolic Stability in CYP2D6 SUPERSOMES™

Human CYP2D6 SUPERSOMES™ were purchased from GenTest (Woburn, Mass., USA). 7.5 mM stock solutions of test compounds (Compounds 100, 102, 104, 106, dextromethorphan, a deuterated analog of dextromethorphan wherein each methyl group was replaced with CD₃ ("d₆-dextromethorphan"), chemical name (+)-3-d₆-methoxy-17-d₆-methyl-(9α,13α,14α)-morphinan, also referred to as Compound 101 in U.S. Ser. No. 12/112,936, and as "Test Compound" in FIG. 1 and Table 2 below), the ethyl ether analog of dextromethorphan ("dextroethorphan") or the isopropyl ether analog of dextromethorphan ("dextroisoproporphan") were prepared in DMSO. The 7.5 mM stock solutions were diluted to 50 μM in acetonitrile (ACN). The 1000 pmol/mL CYP2D6 supersomes were diluted to 62.5 pmol/mL in 0.1 M potassium phosphate buffer, pH 7.4, containing 3 mM MgCl₂. The diluted SUPERSOMES™ were added to wells of a 96-well deep-well polypropylene plate in triplicate. 10 μL of the 50 μM test compound was added to the supersomes and the mixture was pre-warmed for 10 minutes. Reactions were initiated by addition of pre-warmed NADPH solution. The final reaction volume was 0.5 mL and contained 50 pmol/mL CYP2D6 SUPERSOMES™, 1 μM test compound, and 2 mM NADPH in 0.1 M potassium phosphate buffer, pH 7.4, and 3 mM MgCl₂. The reaction mixtures were incubated at 37°C. 50 μL aliquots were removed at 0, 5, 10, 20, and 30 minutes and added to shallow-well 96-well plates which contained 50 μL of ice-cold ACN with internal standard to stop the reactions. The plates were stored at 4°C for 20 minutes after which 100 μL of water was added to the wells of the plate before centrifugation to pellet precipitated proteins. Supernatants were transferred to another 96-well plate and analyzed for amounts of parent remaining by LC-MS/MS using an Applied Bio-systems API 4000 mass spectrometer.

The in vitro half-life (t₁/₂) for each of the test compounds was calculated from the slopes of the linear regression of % parent remaining (ln) vs incubation time relationship: in vitro t₁/₂ = -0.693k, where k = -[slope of linear regression of % par-
FIG. 1 and Table 2, below, show the results of the SUPERSOMES™ experiment. Note that in FIG. 1, the curves for Compounds 100 and 104 overlap one another. “Test Compound” in FIG. 1 and Table 2 refers to deuterated dextromethorphan (“d6-dextromethorphan”, (+)-3-d3-methoxy-17-d3-methyl-9c,13α,14α)-morphinan, which is also referred to as Compound 101 in U.S. Ser. No. 12/112,936, incorporated by reference herein).

Each of the deuterated compounds tested demonstrated a longer half-life when incubated with CYP2D6 SUPERSOMES™ than any of the corresponding undeuterated test compounds or a deuterated version of dextromethorphan (Test Compound). Thus, in this assay, the compounds of this invention were more resistant to metabolism than dextromethorphan or deuterated dextromethorphan (Test Compound).

Example 9

Determination of Metabolic Stability of Test Compounds Using Human Liver Microsomes

Human liver microsomes (20 mg/mL) were obtained from Xenotech, I.T.C. (Lenexa, Kans.). β-nicotinamide adenine dinucleotide phosphate, reduced form (NADPH), magnesium chloride (MgCl2), and dimethyl sulfoxide (DMSO) were purchased from Sigma-Aldrich.

7.5 mM stock solutions of test compounds were prepared in DMSO. The 7.5 mM stock solutions were diluted to 50 μM in acetonitrile (ACN). The 20 mg/mL human liver microsomes were diluted to 1.25 mg/mL (1 mg/mL final) in 0.1 M potassium phosphate buffer, pH 7.4, containing 3 mM MgCl2. The diluted microsomes (375 μL) were added to wells of a 96-well polypropylene plate in triplicate. 10 μL of the 50 μM test compound was added to the microsomes and the mixture was pre-warmed for 10 minutes. Reactions were initiated by addition of 125 μL of pre-warmed NADPH solution. The final reaction volume was 0.5 mL and contained 1.0 mg/mL human liver microsomes, 1 μM test compound, and 2 mM NADPH in 0.1 M potassium phosphate buffer, pH 7.4, and 3 mM MgCl2. The reaction mixtures were incubated at 37° C., and 50 μL aliquots were removed at 0, 5, 10, 20, and 30 minutes and added to shallow 96-well plates which contained 50 μL of ice-cold ACN with internal standard to stop the reactions. The plates were stored at 4° C. for 20 minutes after which 100 μL of water was added to the wells of the plate before centrifugation to pellet precipitated proteins. Supernatants were transferred to another 96-well plate and analyzed for amounts of parent remaining by LC-MS/MS using an Applied Bio-systems API 4000 mass spectrometer.

7-ethoxy coumarin was used as a positive control.

The in vitro t1/2 for test compounds were calculated from the slopes of the linear regression of % parent remaining (ln) vs incubation time relationship:

\[ \text{in vitro } t_{1/2} = \frac{-\ln(2)}{k} \]

where \( k = -[\text{slope of linear regression of } \% \text{ parent remaining } (\ln) \text{ vs incubation time}] \)

Data analysis was performed using Microsoft Excel Software.

FIG. 2 (panels A and B), FIG. 3, Table 3, and Table 4 show the results of this experiment.

TABLE 3

In the case of both dextroethorphan and dextroisoproporphaphan, deuteration of the alkyl ether (R1) resulted in a significant increase in half-life (t1/2) in human liver microsomes as compared to the undeuterated counterpart.

</tbody>
</table>

In the case of dimemorphan, deuteration of R2 resulted in a significant increase in half life (t1/2) in human liver microsomes as compared to the undeuterated counterpart. Deuteration of the N-methyl moiety (R3) caused a further significant increase in t1/2.

Without further description, it is believed that one or ordinary skill in the art can, using the preceding description and the illustrative examples, make and utilize the compounds of the present invention and practice the claimed methods. It should be understood that the foregoing discussion and examples merely present a detailed description of certain preferred embodiments. It will be apparent to those of ordinary skill in the art that various modifications and equivalents can be made without departing from the spirit and scope of the invention. All the patents, journal articles and other documents discussed or cited above are herein incorporated by reference.
We claim:

1. A compound of Formula I:

   \[
   \text{R}^1 \quad \text{R}^2
   \]

   or a pharmaceutically acceptable salt thereof, wherein:
   \(\text{R}^1\) is \(-(C_1-C_4)\text{alkyl}, wherein \(\text{R}^1\) is optionally substituted with one or more deuterium atoms; and
   \(\text{R}^2\) is selected from \(\text{CH}_3\), \(\text{CH}_2\text{D}\), \(\text{CHD}_2\), and \(\text{CD}_3\);
   provided that at least one deuterium atom is present at either \(\text{R}^1\) or \(\text{R}^2\).

2. The compound of claim 1, wherein \(\text{R}^2\) is \(\text{CH}_3\) or \(\text{CD}_3\).

3. The compound of claim 1, wherein \(\text{R}^1\) is \(-\text{CH}_3\), \(-\text{CD}_3\), \(-\text{CH}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CH}(\text{CH}_3)_2\), \(-\text{CD}(\text{CD}_3)_2\), \(-\text{CD}(\text{CD}_3)_2\), \(-\text{CD}(\text{CD}_3)_2\), \(-\text{CD}(\text{CD}_3)_2\), or \(-\text{CD}(\text{CD}_3)_2\).

4. The compound of claim 3, wherein \(\text{R}^1\) is \(-\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), or \(-\text{CD}_2\text{CD}_3\).

5. The compound of claim 5, wherein \(\text{R}^1\) is \(-\text{CD}_3\), \(-\text{CD}_2\text{CD}_3\), or \(-\text{CD}_2\text{CD}_3\).

6. The compound of claim 3, wherein \(\text{R}^1\) is \(-\text{CH}_3\), \(-\text{CH}_2\text{CH}_3\), \(-\text{CH}(\text{CH}_3)_2\), or \(-\text{CH}(\text{CH}_3)_2\) and \(\text{R}^2\) is selected from \(\text{CD}_3\).

7. The compound of claim 1, wherein any atom not designated as deuterium is present at its natural isotopic abundance.

8. The compound of claim 3, selected from any one of:

   \[
   \text{Compound 108}
   \]

or a pharmaceutically acceptable salt thereof, wherein any atom not designated as deuterium is present at its natural isotopic abundance.

10. A pyrogen-free pharmaceutical composition comprising the compound of claim 1 or a pharmaceutically acceptable salt thereof and a pharmaceutically acceptable carrier.

11. The composition of claim 10, wherein the second therapeutic agent is selected from quinidine, quinidine sulfate, oxycodone, and gabapentin.

12. The compound of claim 1, wherein deuterium incorporation at any atom designated as deuterium is at least 90%.

13. The compound of claim 12, wherein deuterium incorporation at any atom designated as deuterium is at least 95%.

14. The compound of claim 9, wherein deuterium incorporation at any atom designated as deuterium is at least 90%.

15. The compound of claim 14, wherein deuterium incorporation at any atom designated as deuterium is at least 95%.
